Schedule 4 Significant Ecological Areas – Marine Schedule

Factors for assessing ecological value [rps]

An area shall be considered an area of significant indigenous vegetation and/or a significant habitat of indigenous fauna in the coastal marine area if it meets one or more of the sub-factors (1) to (6) below, with factors (1) to (5) being applied first, and factor (6) last to identify gaps in representation across marine habitats and ecosystems, and to identify best examples of each habitat or ecosystem. These factors are also referred to in B7.2.2(3).

[CIV-2016-404-002343: Royal Forest and Bird Protection Society of New Zealand Incorporated]

Areas are not considered to be of significant ecological value – marine if they meet one of the exclusion indicators identified in (7)(a) to (d).

These factors have been used to determine the areas included in Schedule 4 Significant Ecological Areas – Marine Schedule, and will be used to assess proposed future additions to the schedule.

FACTORS:

- (1) RECOGNISED INTERNATIONAL OR NATIONAL SIGNIFICANCE Sub-factor:
 - (a) it is an area identified as internationally or nationally significant for either indigenous marine ecosystems or biodiversity, or with reference to the species that utilise these ecosystems.

(2) THREAT STATUS AND RARITY

Sub-factors:

- (a) it is a habitat that is required to provide for the life cycle of a marine plant or animal that is locally rare and has been assessed under the New Zealand Threat Classification System (NZTCS), and determined to have a national 'At Risk' conservation status of Naturally Uncommon, Relict, Recovering and Declining; or
- (b) it is a habitat that is required to provide for the life cycle of a plant or animal that occurs naturally in Auckland and has been assessed as having a regional threatened conservation status including Regionally Critical, Endangered and Vulnerable and Serious and Gradual Decline; or
- (c) it is a habitat that is required to provide for the life cycle of a plant or animal that occurs naturally in Auckland and has been assessed by a nationally or internationally recognised assessment process (e.g. NZTCS, IUCN) and determined to have a threatened conservation status including Critical, Endangered, or Vulnerable; or
- (d) it is a habitat that occurs naturally in Auckland and is required to provide for the life cycle of a marine animal that is listed as a Protected Species in Schedule 7A of the Wildlife Act (1953); or

- (e) it is an indigenous marine habitat or ecosystem that occurs naturally in Auckland and has been assessed by the Council or other national assessment process to be threatened based on evidence and expert advice; or
- (f) it is an indigenous vegetation or habitat of indigenous fauna that occurs within an indigenous coastal ecosystem as identified in NZCPS Policy 11b(iii) as being particularly vulnerable to modification.

(3) UNIQUENESS OR DISTINCTIVENESS

Sub-factors:

- (a) it is habitat for a marine plant or animal that is endemic or near-endemic to the Auckland region; or
- (b) it is an indigenous ecosystem that is endemic to the Auckland region or supports ecological assemblages, structural forms or unusual combinations of species that are endemic to the Auckland region; or
- (c) it is a habitat that supports occurrences of a plant, animal or fungi that are the largest specimen or largest population of the indigenous species in Auckland or New Zealand.

(4) **DIVERSITY**

Sub-factors:

- (a) it is an intact habitat sequence extending across an environmental gradient, and including both floral and faunal habitat components; or
- (b) it includes a large number of intertidal and/or subtidal habitats; or
- (c) it is a habitat type that supports a high species richness for its type.

(5) STEPPING STONES, BUFFERS AND MIGRATION PATHWAYS

Sub-factors:

- (a) it is a site which makes an important contribution to the resilience and ecological integrity of surrounding areas; or
- (b) it is part of a network of sites that cumulatively provide important habitat for indigenous fauna or when aggregated make an important contribution to ecological function and integrity; or
- (c) it is an example of an indigenous ecosystem, or habitat of indigenous fauna that is used by key species permanently or intermittently for an essential part of their life cycle, including migratory pathways, roosting or feeding areas; or
- (d) it is an example of an ecosystem, indigenous vegetation or habitat of indigenous fauna, that is immediately adjacent to, and provides protection for, indigenous biodiversity in an existing protected natural area (established for

the purposes of biodiversity protection for either terrestrial or marine protection) or an area identified as significant under the 'threat status and rarity' or 'uniqueness' criteria.

(6) REPRESENTATIVENESS

Sub-factors:

- (a) it is an example of an indigenous marine ecosystem (including both intertidal and sub-tidal habitats, and including both faunal and floral components) that makes up part of at least 10% of the natural extent of each of Auckland's original marine ecosystem types and reflecting the environmental gradients of the region; and
- (b) it is an example of an indigenous marine ecosystem, or habitat of indigenous marine fauna (including both intertidal and sub-tidal habitats, and including both faunal and floral components), that is characteristic or typical of the natural marine ecosystem diversity of Auckland; or
- (c) it is a habitat that is important to indigenous species of Auckland, either seasonally or permanently, including for migratory species and species at different stages of their life cycle (and including refuges from predation, or key habitat for feeding, breeding, spawning, roosting, resting, or haul out areas for marine mammals); or
- (d) it is an ecosystem that contains an intact ecological sequence across an environmental gradient (e.g., intact intertidal vegetation sequence including seagrass, mangrove, saltmarsh, and terrestrial coastal vegetation); or
- (e) it is an ecosystem that contains a large number of marine habitat types, with the full range of habitats represented that is typical for that depth and exposure within the Auckland region; or
- (f) it is a habitat or ecosystem of particular importance for indigenous or migratory species.

(7) EXCLUSION INDICATORS

[CIV-2016-404-002343: Royal Forest and Bird Protection Society of New Zealand Incorporated]

- (a) It is a human-modified or artificial structure or habitat (unless they have been created specifically or primarily for the purpose of protecting or enhancing biodiversity).
- (b) It is a site maintained for aquaculture production of either native or nonindigenous marine fauna or flora.
- (c) It is a novel or synthetic ecosystem dominated by non-indigenous marine fauna or flora.

(d) It is a habitat created by beach nourishment or coastal planting (unless they have been created specifically or primarily for the purpose of protecting or enhancing biodiversity).

Identified Significant Ecological Areas – Marine Overlay [rcp]

Areas that have been assessed against the above factors (and sub-factors) and determined as having significant ecological value – marine are identified on the Plan maps and the significant ecological values for each area is described in Schedule 4

Key to abbreviations:

- SEA-M: Significant Ecological Area Marine
- SEA-M1: Areas which, due to their physical form, scale or inherent values, are considered to be the most vulnerable to any adverse effects of inappropriate subdivision, use and development.
- SEA-M2: Areas are of regional, national or international significance which do not warrant an SEA-M1 identification as they are generally more robust.

ID	Name/ Location	Values of Significant Ecological Area - Marine	SEA-M type
1	Port Albert		
1w1	Wading bird habitat	Intertidal banks providing habitat and feeding ground for wading birds. Mangroves fringing inlet and wading bird habitat.	SEA-M2w
1b	Atiu Creek	Coastal regional park with intact sequences from native forest to mangroves and estuarine ecosystems in Mullet Creek, Atiu Creek and Takahe Creek. The native forest on the park includes stands of regenerating kanuka forest and scrubland, mature pohutukawa coastal forest, kauri forest on the ridges, and totara forest with broadleaved forest in the gullies. On the prominent Kauri Point there are sequences of totara forest on ridges to coastal pohutukawa- puriri forest and to mangroves in the estuary. Large old growth mangroves occur in Takahe Creek. The park has intact areas of coastal forest which are now rare nationally.	SEA-M1
1c	Oruawharo River	Shallow intertidal habitats dominated by	SEA-M2

SEA-M1w and SEA-M2w: Areas that are identified as significant wading bird areas.

	– Port Albert	mangrove communities with fringing saltmarsh providing habitat for banded rail. Contiguous coastal forest present in upper reaches, including Topunui River. Mangrove communities in Oruawharo arm are different from other mangrove areas in Kaipara Harbour with small deposit-feeding bivalve and polychaete predators present.	
2	Tapora Islands and Estuary		
2a	Intertidal Areas including Gum Store Creek	Area of sand banks, bars and dunes opposite the mouth of the Kaipara Harbour forming a complex habitat for a variety of animal and plant communities. The intertidal sand banks are a feeding ground and important mid tide roost for thousands of international migratory and New Zealand endemic wading birds including a number of threatened species. There is an area of mangrove and saltmarsh within inlet at the mouth of Oruawharo River which is contiguous	SEA-M1
2 b, c, d, e, f, g, h, i	Tapora Islands and estuary	with surrounding coastal forest. The associated sand bars and islands (2b, 2g, 2j) provide a high tide roost for thousands of international migratory and New Zealand endemic wading birds including a number of threatened species and a variety of other coastal bird species. In the shelter of the sand islands and inlet mouths grow important areas of mangroves and saltmarsh (2c, 2d, 2e, 2f, 2h, 2i, 2j). The vegetation adjoining the islands grades from the mangroves and saltmarsh into coastal shrublands and dune vegetation above Mean High Water Springs. Similarly, in the inlet mouths, the saline vegetation grades into freshwater vegetation beyond the coastal marine area. The saline vegetation provides high quality habitat for threatened secretive coastal fringe birds particularly where it abuts terrestrial vegetation which provides shelter for the_birds and potential	SEA-M1

			1
		nesting sites. The saltmarshes and dune vegetation include a number of threatened plant species, including pingao ('gradual decline').	
2j	Okahukura Peninsula Wetland	Estuarine wetland that is only inundated at extreme high tide, that provides habitat for threatened secretive wetland bird species. High plant species diversity, including good amounts of salt marsh ribbonwood with reeds and rushes grading into saltmarsh. Forms part of an ecological sequence from marine to freshwater backdune wetland.	SEA-M1
2k	Intertidal banks on north side of Big Sand Island	The Kaipara Harbour has been identified as an Important Bird Area (IBA) for its global significance for NZ fairy tern ('nationally critical'), black-billed gull ('nationally critical'), NZ dotterel ('nationally vulnerable'), and for its congregations of wading birds which migrate from their South Island breeding sites, and for species migrating from the northern hemisphere. The banks on the north side of Big Sand Island provide wading bird foraging habitat for wrybill ('nationally vulnerable'), South Island pied oystercatcher ('at risk – declining'), Eastern bar-tailed godwit (''at risk- declining') and red knot ('nationally vulnerable').	SEA-M1
2w1	Wading bird habitat	Feeding ground and mid tide roost for thousands of international migratory and New Zealand endemic wading birds including a number of threatened species. High tide roost for thousands of international migratory and New Zealand endemic wading birds including a number of threatened species and a variety of other coastal bird species.	SEA-M1w
949	SEA-terrestrial site below MHWS	Area of saltmarsh and shell banks contiguous with coastal shrubland and forest to east.	SEA-M2
3	Tauhoa River		
	Intertidal banks of	Extensive area of intertidal banks	SEA-M1

		global significance for NZ fairy tern	
183	Flats	The Kaipara Harbour has been identified as an Important Bird Area (IBA) for its	SEA-IVIZ
102	Kakaraia	regionally threatened plant species.	SEA-M2
		breeding colony of grey-faced petrel which is unusual for the west coast of the region. Supports nationally and	
-7		important wildlife habitat as it supports a

		fauna.	
		excellent saltmarsh and rich intertidal	
	Tauhoa River	associated with Tauhoa River, fringed with mangroves and supporting	

		('nationally critical'), black-billed gull ('nationally critical'), NZ dotterel ('nationally vulnerable'), and for its congregations of wading birds which migrate from their South Island breeding sites, and for species migrating from the northern hemisphere. The Kakaraia	
		Flats provide wading bird foraging habitat for wrybill ('nationally vulnerable'), South Island pied oystercatcher ('at risk – declining'), Eastern bar-tailed godwit ('at risk- declining') and red knot ('nationally vulnerable')."	
174	Kaipara Harbour seagrass meadows	Seagrass meadows provide a number of important roles, including trapping and stabilising bottom sediments, nutrient recycling, the creation of high primary productivity, and the provision of habitat to a wide variety of plant and animal species, including invertebrates, fish and birds. Seagrass meadows tend to have greater numbers of fish and species diversity than adjacent non-vegetated habitats. Kaipara Harbour's vast seagrass meadows support a wide variety of fish and the harbour is the main source of juvenile snapper for the west coast of the North Island.	SEA-M1
180	Kakanui Point Flats	The Kaipara Harbour has been identified as an Important Bird Area (IBA) for its global significance for NZ fairy tern ('nationally critical'), black-billed gull ('nationally critical'), NZ dotterel ('nationally vulnerable'), and for its congregations of wading birds which migrate from their South Island breeding sites, and for species migrating from the northern hemisphere. The flats off Kakanui Point provide wading bird foraging habitat for wrybill ('nationally vulnerable'), South Island pied oystercatcher ('at risk – declining'), Eastern bar-tailed godwit (''at risk- declining') and red knot ('nationally vulnerable').	SEA-M2

5	Mataia		
5a		Along the coast in the southern part of this area, developing mangroves below Mean High Water Springs grade into regenerating coastal kanuka forest. This type of connection is now rare in the main body of the Kaipara Harbour due to vegetation clearance and Reclamation around the harbour. Most other such gradations between natural saline and terrestrial vegetation in the Kaipara are found in the estuaries or rivers that flow into the harbour. Provides habitat for wading birds and secretive wetland birds.	SEA-M1
5b	Hoteo River	Mangroves and saltmarsh at mouth of Hoteo River. Provides habitat for banded rail.	SEA-M2
5c	Mataia Creek	Mangroves and saltmarsh in estuarine creek grading into coastal forest on northern side. Provides habitat for banded rail.	SEA-M2
5w1 - 2	Wading bird habitat	Extensive areas of feeding habitat for waders along this coastline.	SEA-M1w
6	Jordan's Farm, Oyster Point and Shelly Beach Island		
6a	Intertidal banks	Area of intertidal banks, shellbanks and mangroves forming a complex habitat for a variety of animal and plant communities. The rich intertidal banks are a feeding ground for thousands of international migratory and New Zealand endemic wading birds including a number of threatened species. The Kaipara Harbour has been identified as an Important Bird Area (IBA) for its global significance for NZ fairy tern ('nationally critical'), black-billed gull ('nationally critical'), NZ dotterel ('nationally vulnerable'), and for its congregations of wading birds which migrate from their South Island breeding	SEA-M2

6b-d	South Kaipara roosts	sites, and for species migrating from the northern hemisphere. The flats off Oyster Point provide wading bird foraging habitat for wrybill ('nationally vulnerable'), South Island pied oystercatcher ('at risk – declining'), Eastern bar-tailed godwit (''at risk- declining') and red knot ('nationally vulnerable')." Shelly Beach Island (6c) and nearby pasture on Jordan's Farm and Oyster Point collectively provide the numerically most important high tide roost on the Kaipara for these birds and a variety of other coastal bird species. Shelly Beach Island is a key area in the Kaipara Harbour for marine bird species. In recent years it has become a major nesting site for Caspian tern, a threatened coastal bird, with around 500 birds nesting on the island. In the shelter of the shellbanks at Shelly Beach Island and Oyster Point (6c, 6d) and in the mouth of the Makarau River (6b) grow important areas of mangroves and saltmarsh. The vegetation grades from the mangroves and saltmarsh into coastal shrublands above Mean High Water Springs at Shelly Beach Island and Oyster Point (6c, 6d) and into mature kanuka forest with emergent tanekaha and kauri at the Makarau River (6b). The saline vegetation provides high quality habitat for threatened secretive coastal fringe birds. The Department of Conservation has selected this area, with the addition of an area of intertidal bank to the north, as an Area of Significant Conservation Value (ASCV). Mangroves and saltmarsh in creek and	SEA-M1
		coastline to north of Oyster Point. Habitat for banded rail.	
6f	Matawhero Stream	Mangroves and saltmarsh at mouth of Matawhero Stream, contiguous with coastal forest in Kapakapa Scientific Reserve. Habitat for banded rail.	SEA-M2
6w1-3	Wading bird habitat	Shellbanks form key roosting and nesting sites for shorebirds and there is extensive intertidal feeding habitat	SEA-M1w

		along this coastline.	
168w	Shelly Beach	Beach and intertidal habitat in Kaipara Harbour providing a significant area for wading birds.	SEA-M2w
7	Kaipara River Mouth		
7a	Kaipara River West Bank	Very extensive area of mangroves within the coastal marine area which grades into areas of saltmarsh. These areas, in turn, grade into the terrestrial vegetation growing on the highest ground. The mangroves and saltmarsh vegetation provides habitat for threatened secretive coastal fringe birds. Areas of adjacent terrestrial vegetation provide shelter for the birds and potential nesting sites. The Kaipara Harbour has been identified as an Important Bird Area (IBA) for its global significance for NZ fairy tern ('nationally critical'), black-billed gull ('nationally critical'), NZ dotterel ('nationally vulnerable'), and for its congregations of wading birds which migrate from their South Island breeding sites, and for species migrating from the northern hemisphere. The flats on the east and west of Kaipara River provide wading bird foraging habitat for wrybill ('nationally vulnerable'), South Island pied oystercatcher ('at risk – declining'), Eastern bar-tailed godwit (''at risk- declining') and red knot ('nationally vulnerable').	SEA-M2
7b	Kaipara River (East Bank)	The southern part of the saline vegetation on the eastern bank of the Kaipara River is the largest single block of dense mangrove in the region and is in good condition and spreading. The saline vegetation provides habitat for threatened secretive coastal fringe birds. Areas of adjacent terrestrial vegetation provide shelter for the birds and potential nesting sites.	SEA-M1
8	Puharakeke		
8a	Intertidal banks	Extensive area of intertidal banks fringed with mangroves on the sheltered	SEA-M2

		edges and with shellbanks on the more exposed parts. Supports a range of saltmarsh and mangrove vegetation. The mangroves and saltmarsh vegetation provides habitat for threatened secretive coastal fringe birds. This is one of two areas containing the most extensive saline vegetation in the Kaipara Harbour and has been relatively unmodified by reclamation in the last 40 years.	
8b-d	Islands and shellbanks	Many of the banks (8b, 8c, 8d) have built up to form low islands and the saline vegetation in the intertidal area grades into the terrestrial vegetation growing above Mean High Water Springs. The saline vegetation provides habitat for threatened secretive coastal fringe birds. This is one of two areas containing the most extensive saline vegetation in the Kaipara Harbour and has been relatively unmodified by reclamation in the last 40 years.	SEA-M1
8e	Puharakeke Stream and intertidal flats	The Kaipara Harbour has been identified as an Important Bird Area (IBA) for its global significance for NZ fairy tern ('nationally critical'), black-billed gull ('nationally critical'), NZ dotterel ('nationally vulnerable'), and for its congregations of wading birds which migrate from their South Island breeding sites, and for species migrating from the northern hemisphere. Puharakeke Stream, in the south Kaipara Harbour, is a known feeding area for NZ fairy tern, particularly in the post-breeding months, and they are roost at nearby Tuparekura on neap high tides	SEA-M2
8w1	Wading bird habitat	Shellbanks form key roosting and nesting sites for shorebirds and there is extensive intertidal feeding habitat for waders along this coastline.	SEA-M2w
9	Omokoiti		
9a	Saltmarsh and intertidal flats	Large and diverse area of saltmarsh and mangrove vegetation contiguous with 9b and with the intertidal banks (9w1) which	SEA-M2

	<u>.</u>		
		are a feeding ground for the thousands of waders that roost at Omokoiti.	
9b	Saltmarsh	Large and diverse area of saltmarsh and mangrove vegetation comprised mainly of a sizeable area of mud and glasswort to landward of a broad band of mangroves. This glasswort flat provides a high tide roosting site for thousands of international migratory and New Zealand endemic wading birds and a variety of other coastal bird species, including a number of threatened species. Most importantly, four or five black stilts, or about 10% of the entire population of this endangered species, spend the winter at this site. The saline vegetation is a habitat for threatened secretive coastal fringe birds.	SEA-M1
9w1	Wading bird habitat	The intertidal banks are a feeding ground for the thousands of waders that roost at Omokoiti.	SEA-M2w
9w2	Wading bird habitat	Extensive areas of feeding habitat for waders along this coastline.	SEA-M1w
10	South Kaipara Head		
10a, b	Waionui Inlet	Wainui Inlet is a large estuarine ecosystem (10a) that is an important feeding ground and high tide roost for a large number of wading birds, including threatened species. In the southernmost parts of the inlet (10b) there are sizeable areas of mangroves and saltmarshes which form notable ecotones with the surrounding terrestrial vegetation. On the eastern side these grade into mature manuka – kanuka forest, while on the western side they are bordered by duneland and seasonal wetland, both of which provide a habitat for a variety of threatened plants. Secretive and threatened coastal fringe birds use the margins of the lagoon habitat, particularly where terrestrial vegetation offers shelter for roosting and	SEA-M1

		has a discust Den (1911) - 1911 - 1913	
		breeding. Bar-tailed godwit; Lesser knot; South Island pied oystercatcher; New Zealand dotterel ('nationally vulnerable'); Variable oystercatcher; Wrybill ('nationally vulnerable'); Turnstone; Red-necked stint. One of few estuary areas in Kaipara Harbour without a pastoral catchment.	
10c	Papakanui Spit	Papakanui Spit is a 3 kilometre long active sand spit almost enclosing Wainui Inlet. The spit is also used as a high tide roost by thousands of international migratory and New Zealand endemic wading birds including a number of threatened species. The large sand spit is one of the largest nesting areas in New Zealand for white fronted terns. Major breeding site for wading birds on the Kaipara harbour, in particular New Zealand dotterels ('nationally vulnerable') and variable oystercatchers. Is one of only three sites in New Zealand where New Zealand fairy tern ('nationally critical') breed. New Zealand dotterel, variable oystercatcher, banded dotterel, black-backed gulls (northern-mostcolony) nest on the spit.	SEA-M1
10d	Dune fields	A large area of mobile dune fields. Extensive areas of pingao-spinifex on active dunes, while kanuka colonising more stable dune areas. Very rare and endangered vegetation type in New Zealand and a high priority for biodiversity protection.	SEA-M1
10w1	Wading bird habitat	Extensive areas of feeding habitat for waders along this coastline.	SEA-M1w
11	Oaia Island	Oaia Island is one of four sites near Muriwai that support breeding colonies of the Australasian gannet. It is also used regularly as ahaulout site by New Zealand fur seals. Cooks scurvey grass, a nationally threatened plant has	SEA-M1

12MuriwaiRepresentative stretch of exposed sandy beach supporting a typical range of bivalves which live burrowed deeply into the sand around extreme low water springs. Muriwai and Rangitira Beaches are the only locations in Auckland where toheroa are found.SEA-M213West Coast (Muriwai to Karekare)The rocky shores support a diverse range of marine algae and invertebrates and, under the influence of cool currents, show affinities with marine ecosystems to the south. From O'Neill Bay to Piha is the only part of the region in which bulk leb, a marine alga of cooler waters, is found in significant quantities. The least accessible, and therefore least modified stretch of coast is from Maori Bay to Te Henga. The rocky coast also provides a variety of habitats for animals and plants, including an important array of threatened cliff-dwelling plants. In most places, the marine ecosystem grades into areas of natural coastal vegetation, some of which is considered to be amongst the best in the Waitakere ecological district (13a, 13c, 13h, 13i, 13i, 13k, 13i). In several places, large sandy beaches have accumulated and, in combination with the rocky shores, these provide a variety of habitats for animals and plants, including plants, including plants, including an important array of threatened cliff dwelling plants.  	[
some of which is considered to be	
amongst the best in the Waitakere	
ecological district (13a, 13c, 13h, 13i,	
13k, 13m). A variety of coastal and sea	
birds breed on the cliffs and islands and	
feed in the surrounding waters (13c,	
13i). Area contains best and only area	
of coastal shrubland in Waitakere	
Ecological District, on the gentle	
slopeat the base of the cliff at Maori	
Bay. There is a considerable variety of	
coastal vegetation types in this area.	
The Muriwai gannet colony is the	
northern most mainland breeding	
colony. The 4km section of coast which	
extends from Bartrum Bay in the north	
to the northern end of O'Neill Bay in the	
south contains high intertidal	
biodiversity values. This section is	
dominated by rocky shores, with a	
number of large reefs projecting out into	
the Tasman Sea. The rocky shore is	
broken in a few places by mobile and	
partly stable gravel beaches (especially	
at Te Waharoa, and pocket sand	
beaches. The northern half of this	
section is composed of softer sandstone	
and the southern half by harder volcanic	
conglomerate and even andesite flows in	
the back of O'Neill Bay. Two special,	
more sheltered habitats are located on	
the north side of Tirikohua Pt. and	
inside the northern end of O'Neill Bay.	
On the north side of Tirikohua Pt, large	
sandstone reefs stretch 50m offshore	
and provide considerable shelter to	
large mid to high tide pools tucked in	
behind, which support beds of	
Neptune's necklace with some unusual	
grazers for the exposed west coast,	
such as Cominella maculosa. The north	
end of O'Neill Bay has a mixed mobile	
and stable gravel beach, partly	
sheltered by the rocky Te Raitahinga	

		Point. A combination of the more stable boulders and additional shelter, provides habitat for several unusual west coast gastropods, such as <i>Diloma nigerrima</i> . This length of coast has the most diverse range of habitats on the west coast and as a result the most diverse biota. The high diversity recorded for north Te Henga and O'Neill Bay is partly inflated by the level of historic study its seaweeds have received.	
13h		The marine ecosystem grades into areas of natural coastal vegetation, some of which is considered to be amongst the best in the Waitakere ecological district (13a, 13c, 13h, 13i, 13k, 13m). This area contains the best and only example of coastal flax-manuka scrub on exposed rocky coast in the Waitakere Ecological District on the steep cliff faces at northern end of O'Neill Bay.	SEA-M1
13i	Erangi Point, Ihumoana Island, Kauwahaia Island	The marine ecosystem grades into areas of natural coastal vegetation, some of which is considered to be amongst the best in the Waitakere ecological district (13a, 13c, 13h, 13i, 13k, 13m). A variety of coastal and sea birds breed on the cliffs and islands and feed in the surrounding waters (13c, 13i). Erangi Point is the site of a breeding colony of spotted shag, an endemic species with restricted distribution on the West Coast of Auckland. Kauwahaia Island contains a high diversity of sea bird species. Bird species breeding includegrey-faced petrel, sooty shearwater, diving petrel, and possibly flesh-footed shearwater. Ihumoana Island has remnant grey-faced petrelcolony. One of the best areas of pohutukawa forest on exposed rocky coast occurs on Erangi Point and Ihumoana Island. The best and one of	SEA-M1

		and the average of lease hours and	
		only two examples of karo-houpara	
		forest on exposed rocky coast present	
L		on Kauwahaia and Ihumoana Islands.	
13k		The marine ecosystem grades into areas of natural coastal vegetation,	SEA-M1
		some of which is considered to be	
		amongst the best in the Waitakere	
		ecological district (13a, 13c, 13h, 13i,	
		13k, 13m). Contains the best and only areas of coastal herbfield and coastal	
		shrubland with toetoe and houpara on	
		exposed rocky coast in the Waitakere	
		Ecological District.	
13m		The marine ecosystem grades into	SEA-M1
		areas of natural coastal vegetation,	
		some of which is considered to be	
		amongst the best in the Waitakere	
		ecological district (13a, 13c, 13h, 13i,	
		13k, 13m). Grey-faced petrel nest on	
		cliff tops south of Piha and above Union	
		Bay at Karekare. Blue penguin also nest	
		along the coastline. Contains best	
		coastal flaxland on exposed rocky coast	
		in ecological district area, and best and	
		one of only two examples of coastal	
		sea-cliff rockland on exposed rocky	
		coast. The 1.5km stretch of coast from	
		Paikea Bay to the north end of	
		Anawhata Beach contains high intertidal	
		biodiversity values. It consists of a large	
		expanse of exposed sandy Anawhata	
		beach with rocky shores on either side,	
		and some areas of stable boulder	
		beach, particularly in Paikea Bay and in	
		the shelter of Keyhole Rock. Particular	
		attributes of the Anawhata coast are the	
		habitat diversity attributable to the	
		presence of the sandy beach, the	
		shelter provided in the lee of Keyhole	
		Rock, and the deep low tide guts with	
		bright sponge gardens on the point at	
		the north end of the beach.	
14	Whatipu	A large area of mobile dunes which is	SEA-M1
17		the best example of recent (mostly 1900	
		The best example of recent (mostly 1900	

		to 1930) coastal progradation in New	
		to 1930) coastal progradation in New Zealand, leaving many sea caves stranded in the hills behind. It is considered to be a nationally important landform and is also an important and complex habitat for a variety of animal and plant communities. Relatively high numbers of threatened and bird species roost in the mobile sand areas and feed in the surrounding waters and intertidal areas. Some species breed in the area; this is an important nesting area for white-fronted terns. In most places, the marine ecosystem grades into areas of natural coastal vegetation, including natural pingao and spinifex communities in the more mobile, freshwater wetland vegetation in the damp depressions and around the lakes, flaxlands at the base of the cliffs and forests on the cliffs themselves. Much of this vegetation is considered to be amongst the best in the Waitakere ecological district and much of it is habitat for a range of threatened plants. Secretive and threatened coastal fringe birds use the freshwater habitats, as do a variety of coastal bird species.	
15a	Omanawanui	Because of the combination of strong, cool lateral currents and erosion-resistant rocks, this stretch of coast supports a diverse and rich marine fauna which shows open coast, harbour, and southern affinities. The encrusting fauna – sponges, bryozoans, ascidians, and hydroids – is uncommon elsewhere on the west coast of the North Island and, in fact, some species have not been found anywhere else in New Zealand. The 4km section of coast from Wonga Wonga Bay to Sawyers Pt, on the north side of the Manukau Harbour entrance is an area with high intertidal	SEA-M1

biodivoraity values. It consists of	
biodiversity values. It consists of	
moderately sheltered, hard volcanic	
breccia rocky shores, with stable	
cobble and boulder beaches at Boulder	
Bay, Makaka Bay (Destruction Gully)	
and Waterfall Bay. Boulder Bay and	
Destruction Gully contains the greatest	
diversity of intertidal life of any section	
of similar length along the coast. The	
composition of the biota along this	
section is a mix of exposed west coast	
species that extend into the harbour	
entrance, and sheltered harbour	
species, that do not extend out into the	
Tasman Sea. In addition, there are 19	
species that have only been found alive	
around Waitakere on this coastal	
section (e.g. bivalve Pseudarcopagia	
disculus, brittlestar Ophionereis	
fasciata, suckerfish Trachylochismus	
melobesia, 8micromolluscs, and 4	
seaweeds). This section of coast	
appears to be excellent habitat for	
colourful low tidal nudibranchs, with 6	
species recorded. Reportedly the	
subtidal ecosystems along this section	
of the Waitakere coast are rich and	
diverse. The combination of subtidal	
and intertidal values gives this coastal	
section additional significance. In most	
places, the marine ecosystem grades	
into areas of natural coastal vegetation,	
some of which is considered to be	
amongst the best in the Waitakere	
ecological district. Steep vegetated	
hillslopes rise approximately 200	
metres above the harbour and show a	
gradient from coastal fringe to slope to	
ridge top vegetation. This area is an	
integral part of the Manukau Harbour,	
which is an internationally	
important wetland selected in its entirety	
by the Department of Conservation as	
an Area of Significant Conservation	

		Value (ASCV).	
16	Huia to Cornwallis		
16a		This area is comparable to the Omanawanui area having rich and diverse fauna which reflects the similarly strong, cool lateral currents anderosion-resistant rocks. Close to Huia, the marine ecosystem grades into an area of coastal pohutukawa forest on the cliffs and manuka gumland vegetation higher up. Both of these are considered to be the best in the Waitakere ecological district.	SEA-M1
16b, e		A combination of marine habitats is found in this area. The western area (16b) is comparable to the Omanawanui area having rich and diverse fauna which reflects the similarly strong, cool lateral currents and erosion-resistant rocks. Contiguous with the intertidal area of Huia Bay 16e is an important bird feeding area, including for reef herons ('nationally vulnerable').	SEA-M2
16c, d		The direction and strength of the current changes and boulder beaches become important at the eastern end (16c, 16d). Kakamatua Streamflows from the Waitakere Ranges into the western side of Kakamatua Bay. Freshwater swamp remnants with flax occur on the flood plain and flats to the east of the inlet. The 2.5 km section of coast around the end of Puponga Point, from Cornwallis wharf to the south-east corner of Kakamatua Inlet contains high intertidal biodiversity values. It consists predominantly of rough volcanic breccia rocky shores. Around the point there are several small pocket beaches of sand or stable cobbles, and there is a small sandy beach between the rocks	SEA-M1

	1	-	
		and Cornwallis wharf. The rocks and large boulders around the end of Puponga Point are swept by extremely strong tidal currents, which keep silt from settling. Here at spring low tide, and especially beneath the edges of giant boulders, are the richest intertidal sponge gardens around the Waitakere coast. A minimum of 14 species of sponge occur around the point, and two species of the relatively rare <i>Calliostoma</i> snail, feed on the sponges.	
17	Big Muddy Creek		
17a	Intertidal flats	Within and surrounding this small estuarine inlet there are a variety of habitats with notable gradients and links between them. The lower intertidal flats support dense populations of soft shore fauna and <i>Zostera</i> beds. These grade into dense algal beds in the mid-tidal zone, which in turn grade into extensive mangrove areas in the upper intertidal area. There are also important links between the marine and terrestrial environments.	SEA-M2
17b	Intact sequence from zostera to mangrove to coastal forest	Coastal forest adjoins the mangroves in the more sheltered areas and shoreline rock shelves and shelly beaches in the more exposed areas. The direct connections between terrestrial and saline vegetation benefit the threatened secretive coastal fringe bird species which are found in this inlet which feed in the intertidal areas and nest and roost under the continuous cover on the land. Excellent example of intact sequence from mangrove forest to coastal pohutukawa forest to puriri forest to coastal kanuka forest on southern foothills (best of only two examples in the ecological district)	SEA-M1
17c	Lawry Point Coast	The 2 km stretch of coast extending from the north-east side of Mill Bay to the south-west side of Armour Bay	SEA-M1

[1
		contains high intertidal biodiversity values. It consists of silt- mantled sandstone reefs, and sandstone and andesite boulders at all tidal levels, interspersed with pocket beaches of muddy, sandy and gravelly sediment. Special features of the Lawry Point area include: a) the presence of live, low tide populations of the now rather rare ranellid trumpet shells, – <i>Cabestana</i> <i>spengleri</i> and <i>Cymateum parthenopeum</i> , and historic records of <i>Cabestana</i> <i>tabulata</i> and <i>Ranella australasia</i> , two species that could still very well be present or able to recolonise; b) the presence of several colourful nudibranchs on the same low tidal, scurfy- weed covered sandstone reefs as the trumpet shells – yellow <i>Dendrodoris citrina</i> , and orange-red <i>Rostanga muscula</i> ; c) a highly unusual low tide area, just north of Lawry Point, with stable cobbles heavily encrusted with the shelly tube worm <i>Spirobranchus</i> <i>cariniferus</i> , sitting on sandy mud. The	
		<i>cariniferus</i> , sitting on sandy mud. The sides and undersides of these cobbles support a diverse fauna, including perhaps the richest sea squirt habitat on	
18	Little Muddy Creek	the north Manukau Harbour coast. Similar to Big Muddy Creek, this small estuarine inlet contains a variety of intertidal habitats ranging from mudflats to rocky reefs. There is an uninterrupted sequence from algal beds in the mid-tidal area, to an extensive mangrove marsh in the upper tidal areas into good stands of coastal forest.	SEA-M2
19	Cape Horn	Important ecological corridor of coastal forest remnants which adjoin the coastal marine area along this stretch of coast. Firm papa reefs below the cliff grade quickly into a muddy intertidal flat near	SEA-M1

	I		1
		the channel edge. The bays also support a diversity of fauna. Waders and coastal birds feed throughout the area. This stretch of steep sandstone sea cliffs along the northern side of the Manukau Harbour contains mature broadleaved coastal forest (pohutukawa, puriri, kowhai, kohekohe and mahoe) on the steeper slopes and patches of regenerating manuka gumland on the gentle slopes. Important ecological corridor from Waitakere Ranges to forest patches in Auckland isthmus. Pied shags ('nationally vulnerable') roost in pohutukawa trees and kaka have been recorded in area. The dwarf mistletoe (<i>Korthasella salicornioides</i>) ('naturally uncommon') grows on manuka in the Manukau Domain. Pohutukawa dominates the steepest cliffs which are roost sites for little shags ('naturally uncommon'). Waikowhai Coastal Forest is a steep, south-facing slope with coastal forest which differs from the north facing and inland forest remnants. Has a unique stand of kowhai-kohekohe-pohutukawa forest at Wesley Bay.	
173	Green Bay Coastline	Stretch of steep sandstone sea cliffs along the northern side of the Manukau Harbour with mature coastal broadleaved forest (pohutukawa, puriri, kowhai, kohekohe and mahoe) on the steeper slopes and patches of regenerating manuka gumland scrub on the gentler topography. Important ecological corridor from the Waitakere Ranges to the forest patches on the Auckland Isthmus. Pied shags roost in the pohutukawatrees and kaka have been recorded in the area. At Green Bay, coastal broadleaf-podocarp forest exists on undulating lowland hills dominated by kahikatea and kanuka in	SEA-M2

vegetation types in an ecological sequence including basalt lava shrubland, freshwater wetlands, saltmarsh, and mangroves. The	SEA-M1
pohutukawa dominates the steepest cliffs which are a roost sites for little shags.21Ann's CreekAnn's Creek includes a mosaic of vegetation types in an ecological sequence including basalt lava shrubland, freshwater wetlands, saltmarsh, and mangroves. TheS	SEA-M1
Cliffs which are a roost sites for little shags.21Ann's CreekAnn's Creek includes a mosaic of vegetation types in an ecological sequence including basalt lava shrubland, freshwater wetlands, saltmarsh, and mangroves. TheS	SEA-M1
21 Ann's Creek Ann's Creek includes a mosaic of vegetation types in an ecological sequence including basalt lava shrubland, freshwater wetlands, saltmarsh, and mangroves. The S	SEA-M1

vegetation types in an ecological sequence including basalt lava shrubland, freshwater wetlands, saltmarsh, and mangroves. The	SEA-M1
sequence including basalt lava shrubland, freshwater wetlands, saltmarsh, and mangroves. The	
shrubland, freshwater wetlands, saltmarsh, and mangroves. The	
saltmarsh, and mangroves. The	
freehwater waterd comprises on area	
freshwater wetland comprises an area	
of deep aquifer-fed water dominated by	
raupo and stream (Ann's Creek) which	
is dominated by grasses and sedges.	
The saltwater wetlands include a range	
of habitat types distributed along the	
salinity gradient. These include marsh	
clubrush (in brackish water – where	
salt and freshwater meet), glasswort,	
oioi, ribbonwood and mangrove	
communities. The lava substrate	
supports a shrubland community with a	
patchy distribution of native shrubs but	
the rocky substrate prevents a thick	
shrub cover leaving open patches of	
lava for herbs and ferns. Ann's Creek is	
the only site in the region where a suite	
of native herbs remain growing together	
on lava, indicative of much of the	
vegetation cover of early Auckland.	
These include three threatened	
Geraniums (G. retrorsum ('nationally	
vulnerable'), <i>G. solanderi</i> and	
Pelargonium inodorum). The lava field	
at Ann's Creek isalso the type locality	
for the shrub Coprosma crassifolia	
collected there by William Colenso in	
1846. Mature inanga (Galaxias	
maculatus) spawn there and both	
Australasian bittern ('nationally	
endangered') and banded rail ('naturally	
uncommon') are present.

		the coastline (23a).	
22	South East		
22	South East Mangere Inlet		
22a		Small upper intertidal area supporting a high diversity of native saline vegetation. Seawards is a diverse area of mangroves and saltmarsh, and small raised banks of clean sand supporting several species of plants characteristic of such areas. In the intertidal areas below the vegetated areas are extensive upper intertidal mudflats with dense populations of characteristic species.	SEA-M2
22b		Small upper intertidal area supporting a high diversity of native saline vegetation. In the south-east corner is a 0.25ha meadow of batchelor's button, <i>Cotula</i> <i>coronopifolia</i> .	SEA-M1
23	Ambury		
23a, c	Intertidal flats	The associated intertidal banks (23a, 23c) are a feeding ground for thousands of international migratory and New Zealand endemic wading birds and a variety of other coastal bird species, including a number of threatened species. Mangroves fringe the mouth of the Mangere Inlet (23a) and mangroves on lava flows fringe the Ambury coastline.	SEA-M2
23b		This modified shoreline is used as a high tide roost by thousands of international migratory and New Zealand endemic wading birds including a number of threatened species. It is the most important winter roost on the Manukau Harbour for South Island Pied Oystercatchers. The Manukau Foreshore including Ambury, is one of the most important roosting area for seabirds and wading birds on the Manukau Harbour. Over the last 30	SEA-M1

		South Island pied oystercatcher ('at risk – declining'), Eastern bar-tailed godwit ('at risk-declining') and red knot ('nationally vulnerable').	
26	Ihumatao		
26a	Sandbank,	The Karore intertidal sandbank is a	SEA-M2
	Ihumatao coastline	particularly rich area which provides a	
	and Oruarangi	variety of sand flat habitats between	
	Creek	high tide and low springtide marks. On	
		it grows the most extensive area of	
		eelgrass (Zostera) remaining in the	
		Manukau Harbour. Large numbers of	
		fish and wading birds feed on the	
		Karore Bank, with particularly high	
		densities of some common waders	
		feeding in and around the remaining	
		eelgrass beds. Waterfowl, such as	
		black swans and ducks, feed on the	
		eelgrass itself. The Manukau Harbour	
		has been identified as an Important Bird	
		Area for its global significance for black-	
		billed gull ('nationally critical'), NZ	
		dotterel ('nationally vulnerable'), and for	
		its congregations of wading birds which	
		migrate from their South Island breeding	
		sites, and for species migrating from the	
		northern hemisphere. The Karore Bank	
		provides wading bird foraging habitat for wrybill ('nationally vulnerable'), South	
		Island pied oystercatcher ('at risk –	
		declining'), Eastern bar-tailed godwit ('at	
		risk-declining') and red knot ('nationally	
		vulnerable').	
		The coastline around Ihumatao and	
		Otuataua Stonefields contains coastal	
		vegetation, including in places	
		mangroves and saltmarsh grading into	
		freshwater springs. Oruarangi Creek	
		has been opened up to the tide in 2005	
		as a result of the Mangere Foreshore	
		restoration project. The Otuataua	
		Stonefields historic reserve and waahi	
		tapu site lies inland. Small remnants of	
		volcanic coastal broadleaf forest hug	
		rock spines and slopes within the	

	T		ſ
		reserve. Pohutukawa occurs near the shore and other dominant trees include titoki, karaka, with some puriri, pigeonwood, ngaio and mahoe.	
26w1	Wading bird habitat - Otuataua	Significant area for wading birds. A rich area which provides a variety of sand flat habitats between high tide and low spring tide marksOn it grows the most extensive area of eelgrass (<i>Zostera</i>) remaining in the Manukau Harbour. Large numbers of fish and wading birds feed on the Karore Bank, with particularly high densities of some common waders feeding in and around the remaining_eelgrass beds. Waterfowl, such as black swans and ducks, feed on the eelgrass itself. There is also an artificial bird roost within this area.	SEA-M2w
171w	Pahurehure Coastline	Extensive areas of feeding habitat for waders along this coastline.	SEA-M2
171	Pahurehure Coastline	Mangroves on outer coastline of Pahurehure Inlet, adjoining wading bird habitat (171w) to west of motorway causeway.	
27	Puhinui		
27a	Sand flats, Puhinui Creek	Area of intertidal banks and shellbanks forming a complex habitat for a variety of animal and plant communities. The extensive_gently-graded sand flats support dense populations of intertidal sand flat organisms and are an excellent feeding ground for thousands of international migratory and New Zealand endemic wading birds including a number of threatened species. Much of the intertidal area consists of extensive gently-graded sand flats, inhabited by dense populations of invertebrates. Thousands of international migratory birds and New Zealand endemic waders feed on the sand flats. In the shelter of the Puhinui, Pukaki, and Waokauri Creeks are significant areas of	SEA-M2

		are some of the oldest mangroves in the harbour and have batchelor's button	
		meadows on the fringe inplaces. Banded rail, fernbird and marsh crake.	
27b	Wiroa Island	An artificial roost has been constructed at Wiroa Island and this is widely used by coastal birds. Waders also use this roost, which is the major roost on the Manukau Harbour.	SEA-M1
27c	Shellbanks	The associated shellbanks at Puhinui are used as a high tide roost by thousands of international migratory birds and New Zealand endemic waders. The saltmarsh is impounded behind the shellbanks and is one of the biggest and least disturbed areas of saltmarsh remaining in the Manukau Harbour. Banded rail, and fern bird inhabit the saltmarsh, and the regionally threatened herb <i>Nertera scapanioides</i> ('regionally critical') and nationally threatened Maori musk <i>Mimulus repens</i> ('naturally uncommon') have been reported here. There are intact vegetation ecotones between the shellbank vegetation, the saltmarsh vegetation and into the kanuka forest with kahikatea and rimu on the shore.	SEA-M1
27w1	Wading bird habitat	See 27b and c. Wading bird habitat which includes ecotones from shellbank to saltmarsh to terrestrial vegetation.	SEA-M1w
27w2	Wading bird habitat	See 27a Shellbanks form key roosting and nesting sites for shorebirds and there is extensive intertidal feeding habitat for waders along this coastline.	SEA-M2w
29	Drury		
29a	Creeks and intertidal habitats	This area is comprised of a variety of intertidal habitats ranging from sandy mud intertidal flats, to current-exposed rocky reefs and avariety of saline vegetation. Healthy and often expanding areas of mangroves grow in the shelter of the Whangamaire Stream, and Drury	SEA-M2

29b	Upper reaches Drury Creek	and Whangapouri Creeks and in the southern half of the Whangapouri Creek are notable eelgrass (<i>Zostera</i>) beds. Drury Creek is comprised of a variety of intertidal habitats ranging from sandy mud intertidal flats to current-exposed rocky reefs and a variety of saline vegetation. Wading bird roosting area, including important area for pied stilt. Within the upper tidal reaches of Drury Creek there are a variety of marshes, grading from mangroves through to extensive areas of jointed rush-dominated saltmarsh, to	SEA-M1
		freshwater vegetation in response to salinity changes. This same area is a migration pathway between marine and freshwater habitats for a number of different species of native freshwater fishes.	
29w1-2	Wading bird habitat	Wading bird habitat including important area for pied stilt (see 29a).	SEA-M2w
30	Clarks Beach to		
	Karaka Point		
30a	Seagrove - intertidal banks	Area of intertidal banks and shellbanks forming a complex habitat for a variety of animal and plant communities. The extensive gently-graded predominantly fine sand flats support the greatest diversity and abundance of intertidal sand flat organisms in the Manukau Harbour. They are an excellent feeding ground for many thousands of international migratory and New Zealand endemic wading birds including a number of threatened species.	SEA-M2
30b	Karaka roosts – shellbanks; Seagrove coastline and Clarks Creek	Several shellbanks have developed just offshore at Karaka since the early to mid 1980's and are now numerically the most important roost on the Manukau Harbour, most notably for waders, but also for a variety of coastal birds. There are a number of other roosts	SEA-M1

r			1
		along the shore, most notably near	
		Seagrove, the second most important	
		roosting site on the harbour. These are	
		used during most high tides, but during	
		high spring tides at Seagrove, the birds	
		move onto adjacent pasture. There is a	
		variety of saline vegetation within this	
		area. The intertidal flats between Clarks	
		Beach and Seagrove were the site of	
		very extensive beds of eelgrass.	
		Eelgrass beds declined sharply, but	
		have been reappearing around the	
		region in recent years. The Department	
		of Conservation has selected the roosts	
		and closely adjacent intertidal banks as	
		an Area of Significant Conservation	
		Value (ASCV). Along the shores there	
		are fringes of saltmarsh, which reach	
		their greatest extent and best condition	
		along the northern shore of Seagrove	
		Peninsula. Within the creek itself, at	
		Seagrove, there are areas of healthy	
		areas of mangroves.	
30w1	Wading bird	Several shellbanks offshore at Karaka	SEA-M1w

		threatened species.	
35	Awhitu	A range of shoreline habitats are found	SEA-M2
		along the shores of Awhitu Regional	
		Park and in the Kauritutahi Stream.	
		These support a large range of wading	
		and coastal birds in addition to a number	
		of threatened coastal fringe and wetland	
		birds that dwell in the saline vegetation.	
		Contains intact sequences from	
		shoreline habitats to mangrove,	
		estuarine and freshwater wetlands.	
		Banded rail and North Island fern bird	
		inhabit wetlands and coastal margins.	
		The area is an integral part of the	
		Manukau Harbour, an internationally	
		important wetland selected by the	
		Department of Conservation as an Area	

		of Significant Conservation Value	
		(ASCV).	
36	Awhitu South Head to Big Bay	This area is subjected to strong, cool lateral currents similar to those at Omanawanui on the opposite side of the harbour mouth. Consequently, this stretch of coast also supports a diverse and rich marine fauna which shows open coast, harbour, and southern affinities. The south head contrasts with the north because of the softer rocks and platform reefs which mean that the biota differs and is less diverse and abundant. Remnants of coastal cliff pohutukawa and scrub present at Orua Bay and northern end of Big Bay. Remnants of coastal scrubland and forest on steep coastal dunes.	SEA-M2
37	West Coast of Awhitu Peninsula	Expansive windswept coastline with steep eroding coastal cliffs and dunes. Remnants of coastal flaxland and coastal broadleaved pohutukawa forest, including groves of large remnant pohutukawa. A series of dune lakes occur along the western side of the peninsula. The most extensive area of coastal cliff pohutukawa forest on the west coast of Awhitu Ecological District is present within the stewardship area at Cochranes Gap. The marine ecosystem at Kariotahi grades into areas of coastal vegetation, within which a range of threatened plants grow.	SEA-M2
40	Kawakawa to		
100 ~	Matingarahi	The section of coast from Raukura Point	
40a, g, i		to Orere Point is one of the richest areas in the region for rocky shore and sandy beach flora and fauna. In some places, the marine ecosystem grades into areas of natural coastal vegetation, some of which is considered to be amongst the best in the Hunua ecological district (40a) and at Papanui	SEA-M2

40f		Point (40h) there are a number of threatened plant species within this vegetation. A thin strip of pohutukawa forest occurs along the cliff top between Tapapakanga and Orere. Contains one of the best areas of pohutukawa forest on coastal sediments. The marine ecosystem grades into areas of natural coastal vegetation, which is considered to be amongst the best in the Hunua ecological district. Best coastal pohutukawa forest on alluvial sediments, at Orere Beach Domain.	SEA-M1
40h		The marine ecosystem grades into areas of natural coastal vegetation, which is considered to be amongst the best in the Hunua ecological district and at Papanui Point there are a number of threatened plant species within this vegetation. Best coastal mapou forest withemergent kanuka, tanekaha and pohutukawa, on coastal sediments in the ecological district, on coastal hillslopes adjacent to Tawhitokino Beach. Coastal bird species, including shags, terns and gulls roost in the coastal trees and adjoining rocks. Little blue penguins probably also nest here.	SEA-M1
200w1	Kawakawa Bay Wading bird habitat	Extensive areas of feeding habitat for waders along this coastline.	SEA-M2w
41	Wairoa River and Estuary		
41a	Wairoa River Estuary	Largest east coast river in the region with a complex of intertidal flats and shellbanks that have accumulated at the mouth. These provide a varied habitat for a wide range of animal and plant communities. The intertidal banks are a very rich feeding ground and important mid tide roost for a few thousand international migratory and New Zealand endemic wading birds including a	SEA-M2

			,
		number of threatened species. Moderate numbers of wading birds feed on the mudflats, including godwit, knot, whimbrel, variable oystercatcher, and banded dotterel. Banded rail and fern bird are associated with mangroves and vegetated margins of estuary. 55 bird species have been recorded from the estuary.	
41b	Kauri Bay, Wairoa Estuary	The shellbank at Kauri Bay is important as a breeding ground for the threatened New Zealand dotterel. In the shelter of the shellbanks and the estuarine stretches of the river grow important areas of mangroves and saltmarsh (41b - j) much of it judged to be the best in the ecological district. There is a gradation from saline vegetation into freshwater vegetation beyond the coastal marine area with decreasing salinity moving upstream from the sea. Banded dotterel nest here, and the area provides habitat for banded rail, Caspian tern, fernbird, variable oystercatcher, and golden plover. The saline vegetation provides high quality habitat for threatened secretive coastal fringe birds particularly in saltmarshes where there is terrestrial vegetation which provides roosts for the birds and potential nesting sites.	SEA-M1
41c, e, i, f		Contains the best mangrove forest in the Hunua Ecological District. The area is composed of a number of areas of mangroves which occur from the mouth of the Wairoa River at Poutu Point upstream for approx 3km. Along the river bank mangroves are dense and can reach 6m in height. The total area of mangroves in the estuary is approx. 60ha. 41e grades into the best example of coastal marsh ribbonwood/oioi-sea rush rushland in the ecological district.	SEA-M1
41d		Contains the best example of coastal	SEA-M1

		glasswort herbfield in the Hunua Ecological District.	
41g		Contains the only area of coastal flax-purua grass-marsh ribbonwood flaxland in the Hunua Ecological District.	SEA-M1
41h	Duders wetland	A complex saltmarsh system which is	SEA-M1
		one of the least modified in the	
		ecological district, and includes the best	
		examples of saltmarsh wetland types in	
		the district. Contains coastal tawa forest	
		as well as one of the two best areas of	
		pohutukawa forest in the district, is	
		present on Whakakaiwhara peninsula.

		includes a variety of shoreline habitats	
		includes a variety of shoreline habitats, saline vegetation on mudflats, clubrush (<i>Schoenoplectus</i>) sedgeland in association with mangrove and raupo. The shoreline habitats grade into pohutukawa forest on cliffs and coastal forest areas. Native revegetation is enhancing the natural values of this area. There are two areas of coastal forest: one dominated by mature tanekaha and the other by large puriri and taraire. Both have been fenced from stock. The forest is home to native birds such as fantails, grey warblers, tui and kereru. South Island pied oystercatchers ('at risk declining'), Caspian tern ('nationally vulnerable'), pied shags ('nationally vulnerable') and kingfishers are present on the foreshore and shags rooston pohutukawa. The vegetation is ranked as a Hunua ED Priority Vegetation Site and contains an intact ecological sequence from estuarine to freshwater. Banded rail.	
		The Te Puru Estuary is a Site of	
		Special Wildlife Interest (SSWI) of moderate value.	
43	Turanga Creek Estuary		
43a		Three distinct tidal creeks (Maungamaungaroa, Turanga, and Waikopua) flowing into one large bay, within which a complex of intertidal mud, sand, and shell flats have accumulated. This physical variety provides a similarly varied range of habitats for an assortment of animal and plant communities. The intertidal banks are a very rich feeding ground and important mid tide roost for many hundreds of a variety of international migratory and New Zealand endemic wading birds including a number of threatened species. Turanga Creek is	SEA-M2

			1
		the largest estuarine habitat, including mangrove shrubland ecosystems, in the Hunua Ecological District. The Department of Conservation has selected this area as an Area of Significant Conservation Value (ASCV).	
43b, c, e, f	Shellbanks	Large shellbanks at various locations at creek mouths (43c, 43f), behind the beach (43e), or near Motukaraka Island (43b) are used (or have been used in the past) as high tide roosts by these birds and a variety of other coastal bird species. Moderate numbers of wading birds roost on the shellbanks including godwit, SIPO, whimbrel, reef heron, variable oystercatcher and banded dotterel. The Department of Conservation has selected this area as an Area of Significant Conservation Value (ASCV).	SEA-M1
43d		Contains the best areas of mangrove/oioi rushland and marsh ribbonwood/sea rush rushland in the ecological district.	SEA-M1
43g, h	Mangroves, coastal forest, saltmarsh, islands	There are two major gradations from saline vegetation into terrestrial vegetation. One (43h) is from mangroves into the best coastal pongaand taraire forests on coastal sediments in the ecological district which in turn grades into kowhai forest. The second (43g) grades from mangroves into saltmarsh into coastal shrublands on islands in the Turanga Creek. The saline vegetation fringing the creeks provides high quality habitat for threatened secretive coastal fringe birds particularly where it abuts terrestrial vegetation which provides roosts for the birds and potential nesting sites. These intact sequences from mangrove forest to saltmarsh to coastal shrubland contain the best and only remaining areas of coastal	SEA-M1

		abautabaad and a set of fear of	
		shrubland and coastal forest on	
		estuarine island in the ecological	
		district. The Department of	
		Conservation has selected this area as	
		an Area of Significant Conservation Value (ASCV).

47	Tamaki River East Roost	Tamaki Estuary is a regionally important wildlife habitat. Tamaki River	SEA-M1

		Fact Departies are at the second state]
		East Roost is one of the roosting sites used by some of the hundreds of wading birds that feed within the Tamaki Estuary. This roost is associated with the values of SEA-M 45, 48, and 49. There are a number of other roosting sites (notably Pakuranga Creek Roost and the Tamaki River East Roost), which are used by hundreds of wading birds which feed in the estuary. Intertidal banks (such as the Tamaki East Bank) contain extensive beds of shellfish and are important feeding grounds for these birds.	
48	Tamaki East Bank	This intertidal bank is a feeding ground for the hundreds of wading birds that use the Tamaki Estuary. This feeding ground is associated with the values of SEA-M 45, 47, and 49. This area also includes part of the Farm Cove ignimbrite, most of which is above MHWS. Significant mangrove, saltmarsh and salt meadow sequences are present in Wakaaranga Creek.	SEA-M2
49	Tamaki Estuary West		
49a	Intertidal banks	Large river estuary where considerable areas of intertidal flats have accumulated and a sand-shell spit has built up near the entrance. The spit has been modified to create a variety of freshwater and estuarine habitats. Saltmarsh and mangrove habitats fringe the estuary. The intertidal banks contain extensive beds of shellfish and are a feeding ground for these birds. The spit and associated northern and southern intertidal banks, together comprise a wildlife habitat of regional importance. This area is associated with the values of SEA-M45, 47, and 48.	SEA-M2
49c	Tahuna Torea	The Tahuna Torea spit ('the gathering place of the oystercatcher') has been	SEA-M1

Modified to create a variety of freshwater and estuarine habitats. The estuarine area behind the spit has been dammed and developed by the Tamaki Estuary Protection Society, as a brackish pond for feeding and roosting birds. A freshwater wetland has also been developed as a breeding and feeding area. The area provides an interesting complex of marine, intertidal, freshwater and terrestrial habitats for a wide range of birds. It has added value because of its proximity to, and ready access for, a large number of people. Birds which frequent the area include the South Island pied oystercatcher, variable oyster catcher, Caspian tern, grey teal, pied stilt, godwit, knot, turnstone, golden plover, banded dotterel, New Zealand dotterel, wrybill, black-backed gulls, red-billed gulls, caspian terns, pied shags and little shags; white-faced heron and blue reef heron also feed on the tidal flats.SEA-M149dHigh tide roostLarge river estuary where considerable areas of intertidal flats have accumulated and a sand-shell spit has built up near the entrance. The spit has been modified to create a variety of freshwater and estuarine habitat. 		ecological district grow in the Purewa	
51c	Purewa Stream	Some of the largest mangroves in the ecological district grow in the Purewa	SEA-M1
		Stream area. The value of these	
		mangroves is enhanced by the gradation	
		from mangrove forest into the coastal	
		forest of Purewa Reserve. Purewa Valley	
		contains remnants of coastal forest and	
		one of the finest examples of mangrove	
		forest in the Auckland area with some	
		trees up to 4m in height. Several	
		patches of eelgrass, now a rather	
		uncommon species in the Waitemata	
		Harbour since its devastation by disease	
		in the 1950s, are found on the tidal flats.	
		There are some old kanuka, cabbage	
		trees, kowhai and pohutukawa. The	
		Council and community groups have	
		undertaken the protection and	
		enhancement of this area. Birds of the	
		area include mallard ducks, pied stilts,	
		kingfishers, blue reef herons, grey	
		warblers, tui and pukeko. Banded	
		kokopu have been reported in the gully	
		streams. An undescribed leaf miner was	
		discovered on Pseudopanax lessonii in	
		this bush in 2007 (ARPS). Ecological	
		sequence from mangroves to coastal

52	habitat Te Tokoroa Reef Te Tokoroa Reef	See 51a Extensive areas of feeding habitat for waders along this coastline. Te Tokoroa Reef is a basaltic lava flow which extends into the Waitemata Harbour and provides a range of	

52w1, 2	Wading bird	and nationally recognised originally rare ecosystem type. The hard surface presented by the lava flow is unusual within the Waitemata Harbour and the diverse marine biota it supports, particularly sponges and bryozoans, is correspondingly unusual. The reef is a significant area for wading birds. There are extensive salt marshes and mangrove communities associated with the reef. Te Tokoroa Reef provides key roosting	SEA-M1w
	habitat	and nesting site for shorebirds and there are extensive areas of feeding habitat for waders along this coastline.	
53	Pollen Island	Pollen and Traherne Islands are low-lying islands with extensive shell banks, mangroves and salt marshes, and estuarine and harbour mudflats, and comprise an important wildlife area in the Waitemata Harbour. It is the best remaining largely unmodified area of its type in the Waitemata Harbour and is considered to be of national importance. It forms a complex habitat for a variety of animal and plant communities. Pollen and Traherne Islands and the surrounding shellbanks are the major high tide roost on the Waitemata Harbour for thousands of international migratory and New Zealand endemic wading birds as well as a variety of coastal birds. This includes a number of threatened species. They are also an important breeding and flocking area for the threatened New Zealand Dotterel on the Waitemata Harbour. The surrounding intertidal banks and waters are a feeding ground for all of these birds. The biggest and least disturbed area of saltmarsh remaining in the Waitemata Harbour grows in the shelter of Pollen Island. Here is found an important intergrading of vegetation from	SEA-M1

intertidal flats up onto shellbank.	
Mangroves give way to glasswort	
herbfields which in turn are replaced by	
rush and sedge saltmarsh which grades	
into saltmarsh ribbonwood shrubland on	
Pollen Island itself. The saline	
vegetation is an important habitat for a	
variety of threatened secretive coastal	
fringe birds. It provides a key habitat for	
fern bird. The habitat quality is	
enhanced by the adjoining thick low	
saltmarsh ribbonwood vegetation on the	
Island which provides shelter for the	
birds and offers potential nesting sites. Here is found a valuable population of	
the regionally threatened fern bird. The	
majority of this area was protected as	
the Motu Manawa (Pollen Island) Marine	
Reserve in late 1995. The Department	
of Conservation has selected this area	
as an Area of Significant Conservation	
Value (ASCV). Traherne Island is also	
an important roosting area for birds and	
is the main roost for banded dotterel and	
wrybill in the Waitemata Harbour. New	
Zealand dotterel and fern bird nest in the	
area. The south end of Pollen Island is	
the only known locality in New Zealand	
of the minute ant, Mayriella abstinens; it	
is also the type of locality for a new	
species of psyllid, Anomalopsylle which	
is less than 1mm long. The Pollen	
Island locality is a marine reserve and is	
considered to be of national importance.	
1-2 Wading bird See 53 Shellbanks form key roosting	SEA-M1w
habitat and nesting sites for shorebirds and	
there is extensive intertidal feeding	
habitat for waders along this coastline.	
Whau River The Whau River contains substantial	
quantities of mangrove ecosystems and	SEA-M2

saline vegetation. There are around 40	SEA-M2
	SEA-M2
saline vegetation. There are around 40	SEA-M2

		growing in the firmer high intertidal regions. These in turn grade into a fringe of saltmarsh lining the coast. The saline vegetation is an important habitat for threatened secretive coastal fringe birds particularly where it abuts terrestrial vegetation which provides roosts for the birds at high tide and potential nesting sites. Kingfisher, pied stilt, white-faced heron, red-billed gull, black-backed gull, pied shag, black shag, welcome swallow, and pukeko are among the birds seen in the area.	
55	Te Atatu – Henderson Creek		
55a	Henderson Creek and Te Atatu	This is an area of saltmarsh, mangroves, shellbanks, and estuarine and harbour intertidal banks forming a complex habitat for a variety of animal and plant communities. The intertidal area to the east of the Te Atatu Peninsula is a major wading bird feeding ground. Harbour view Reserve (Te Atatu Peninsula) contains an ecotone from saline to brackish to freshwater wetland and provides habitat for fern bird and banded rail. The eastern side of the Te Atatu peninsula contains extensive high-tidal sand flats, healthy mangroves, a prominent shell bank and a high-tidal salt marsh along the shoreline. Such a combination is unusual to find in the Waitemata Harbour. Gulls, terns, pied stilt, white-faced heron and kingfisher are seen in this area.	SEA-M2
55b,c	High tide roost, shellbank	Nearby extensive clean high-tidal sand flats and a prominent shellbank (55b) offer a high tide roost for some of these wading birds and a variety of coastal birds, as do a series of small shellbanks off the north end of the Te Atatu Peninsula (55c). The latter are considered to be a major roosting area for waders in the Waitemata Harbour	SEA-M1

		there is extensive intertidal feeding	
55w2, 4, 5	Wading bird habitat	See 55a Shellbanks form key roosting and nesting sites for shorebirds and	SEA-M2w
55w1, 3, 6	Wading bird habitat	See 55b, 55cExtensive feeding habitat for waders along this coastline.	SEA-M1w
55d	Henderson Creek	There is an important gradation between saline vegetation in the intertidal area and native towai forest on the slopes above. An extensive and ecologically healthy area of mangrove and salt marshes can be found in the Henderson Creek. Kingfisher, pied stilt, white-faced heron, red-billed gull, black-backed gull, pied shag, black shag, welcome swallow, and pukeko are among the birds seen in the area.	SEA-M1
		and are also a breeding ground used by a range of coastal and wading birds, including a number of threatened species. Large and significant areas of saline vegetation grow in the shelter of these shellbanks. At Te Atatu East (55b) the extensive shell barriers protect high level mangroves with a healthy sedge, rush and glasswort saltmarsh on the shore fringe. At Te Atatu North (55c) there is a large area in which there is either pure mangrove swamp or bare sand flat. Saline vegetation also grows in the shelter of Henderson Creek. Here the edges of the creek are lined with mature mangroves which grow in association with areas of saltmarsh at the mouth of the creek and sedges and eelgrass further up the creek. In one place (55d) there is an important gradation between saline vegetation in the intertidal area and native towai forest on the slopes above. On part of the coast at Te Atatu_North (55c) are found remnants of swamp and estuarine vegetation of Pleistocene age now exposed at intertidal levels.	

56	Hobsonville		
56a	Peninsula Intertidal	Contains wide intertidal mudflats and mangrove shrublands. Wading birds, including threatened species feed in the intertidal area to the east of the peninsula (56a).	SEA-M2
56b	Wading bird roost	At the mouth of Nimrod Inlet and Bomb Bay is a shellbank (56b) that is one of the two major roosts on the Waitemata Harbour for wading birds, including threatened species.	SEA-M1
57b	Herald Island to Lucas Creek	This area is the best example of the muddy, mangrove- lined inlets of the inner Waitemata Harbour. The diversity and productivity of the flora and fauna is generally large with extensive beds of shellfish and abundances of birds and fish. Gradations between the marine environment and either natural freshwater or natural terrestrial systems are a major characteristic of the ramifying arms of the system. These arms are also important as pathways for migration by native freshwater fish. The mangroves and saline vegetation is an important habitat for threatened secretive coastal fringe birds, particularly where it abuts terrestrial vegetation, which provides roosts and potential nest sites for birds. Brighams, Rangitopuni, Paremoremo, Lucas and Hellyers creeks in the upper reaches of the Waitemata Harbour offer largely un spoilt tidal inlets with hill sides of regenerating native forest in the area of Lucas and Paremoremo Creeks. The forest cover here consists of kauri on the ridges with puriri and kahikatea dominant on the slopes and in the gullies. The coastal forest is comprised	SEA-M2

		extensive sheltered intertidal areas	
		extensive sheltered intertidal areas retain large quantities of soft sediment derived from the watershed. The mangroves and salt marshes are important as wildlife habitats. Birds which can be found in the area include black shag, kingfisher and white-fronted tern. A large area of regenerating kauri/ tanekaha-broadleaved forest occurs on the northern Lucas Creek escarpment. It forms part of the largest block of continuous forest in the Tamaki Ecological District. Pohutukawa line the coastal edge of Paremoremo Creek mouth, and significant remnants of coastal forest grade into mangroves.	
57a	Lucas Creek	Mangroves grade into coastal forest on western side of Lucas Creek. The saline vegetation is an important habitat for threatened secretive coastal fringe birds, particularly where it abuts terrestrial vegetation, which provides roosts and potential nest sites for birds. The forest cover here consists of kauri on the ridges with puriri and kahikatea dominant on the slopes and in the gullies. The coastal forest is comprised of pohutukawa, kowhai and karaka. A large area of regenerating kauri/ tanekaha-broadleaved forest occurs on the northern Lucas Creek escarpment. It forms part of the largest block of continuous forest in the Tamaki Ecological District.	SEA-M1
58a	Hellyers Creek	The most significant areas where mangroves grade into coastal forest. Hellyers Creek is important because of the extensive natural connections between the marine and terrestrial environments. Almost all of the block of land to the south of View Road on the northern side of Hellyers Creek is covered with forest (kahikatea, kauri, kohekohe, puriri, taraire, kowhai, and	SEA-M1

		kanuka). This natural vegetation adjoins mangroves which occupy large areas of the upper shore. There is a continuous corridor of regenerating coastal kauri-tanekaha-kanuka-pohutukawa broadleaved forest from the head of Hellyers Creek to Greenhithe, on the northern side of the creek, with intact sequences from mangrove to kauri forest on the ridge. Hard beech is also found along the Hellyers Creek escarpment.	
58b	Hellyers Creek	Hellyers Creek is important because of the extensive natural connections between the marine and terrestrial environments. Almost the entire block of land to the south of View Road on the northern side of Hellyers Creek is covered with forest (kahikatea, kauri, kohekohe, puriri, taraire, kowhai, and kanuka). This natural vegetation adjoins mangroves which occupy large areas of the upper shore. There is a continuous_corridor of regenerating coastal kauri-tanekaha-kanuka-pohutukawa broadleaved forest from the head of Hellyers Creek to Greenhithe, on the northern side of the creek, with intact sequences from mangrove to kauri forest on the ridge. Hard beech is also found along the Hellyers Creek escarpment.	SEA-M2
59	Soldiers Bay	Soldiers Bay has the only intact ecological sequence of mangroves, saline wetland through freshwater to mature native forest in the Tamaki Ecological District and therefore has great ecological value. Pied stilt ('at risk declining'), white-faced heron, kingfisher, gulls, white-fronted tern ('at risk declining'), caspian tern ('nationally vulnerable') and, occasionally, gannet can be seen in the area. Within this	SEA-M1

		bay a variety of intertidal substrates provide a variety of habitats for a range of plants and animals. There are fine firm sandy sediments on the lower shore, softer sediments and shell barrier at the head of the bay, reefs of sandstone extending from the points and accumulations of boulders beneath the cliffs. The intertidal areas provide a feeding area for a variety of coastal birds which roost on the shell barrier. A complex of mangroves and saltmarsh grow in the shelter of the shellbanks and these grade into a sizeable freshwater raupo wetland and into swamp forest with kahikatea and swamp maire ('gradual decline').	
201w	Little Shoal Bay Wading bird habitat	Extensive areas of feeding habitat for waders along this coastline.	SEA-M2w
60	Shoal Bay –		
	Ngataringa Bay		
60a, b	Shoal Bay - intertidal area, Ngataringa Bay intertidal area	Shoal Bay, north of a line east of the Northcote motorway interchange, is an important feeding and roosting area. Caspian tern, New Zealand dotterel, pied stilt, white-faced heron, pukeko, kingfisher and gulls can be seen in the area. Within this area are extensive areas of shellbanks and intertidal sand and mud, which together form a complex habitat for a variety of animal and plant communities. The intertidal area (60a, 60b) is an important wading bird feeding ground. Saltmarsh and mangrove communities grow on the margins of this area (60a, 60b), protected by the shellbanks nearer the mouths of the bays. These areas of saline vegetation offer a good habitat to secretive coastal fringe birds. The coastal vegetation is an outstanding	SEA-M2

		shellbanks to Bolboschoenus/raupo	
		wetlands. Remnants of pohutukawa	
		occur on the fringes of Shoal Bay and Ngataringa Bay.	
60c, d, e, g	Shell banks	Associated shellbanks (60c, 60d, 60e, 60g) are used as a high tide roost by wading birds and a variety of coastal birds. The City of Cork shellbanks and the reconstructed shellbanks created as part of the North Shore Busway are used as a breeding site for New Zealand dotterel. The City of Cork shellbank supports the best example of Stipa-saltmarsh ribbonwood in the Ecological District. The shellbanks beside the motorway are the only roosting area used by the New Zealand dotterel between Traherne Island and Browns Island, and is a nesting area for the New Zealand dotterel, caspian tern and pied stilt.	SEA-M1
60f	Tank Farm	Mangrove and saltmarsh grow within the shelter of the Tank Farm Explosion Crater (60f) and provide important fish and bird habitats. The rich volcanic red-brown loams of this area support remnants of lush broadleaved forest, dominated by old growth kohekohe (uncommon in the Tamaki Ecological District) and lesser amounts of karaka, with stands of pohutukawa, making these one of the few remnants of broadleaved forest on volcanic soils on the North Shore. Together with Onepoto Basin to the west, the forest, lake, freshwater and saline wetland complex supports a diverse range of bird species include pukeko, white-faced heron, black-backed gull, red-billed gull, various species of shag, welcome swallow, fantail, kingfisher, Caspian tern, tui, pigeon, harrier hawk, grey duck, paradise shell duck, grey	SEA-M1

		and brown teal have been recorded	
		here on occasion.	
60w1	Wading bird habitat	See 60a, 60b Extensive feeding habitat for waders along this coastline.	SEA-M2w
60w2-4	Wading bird habitat	See 60d, 60e, 60g Shellbanks form key roosting and nesting sites for shorebirds and there is extensive feeding habitat for waders along this coastline.	SEA-M1w
61	North Head to Takapuna	This stretch of coast consists of a series of rocky headlands of soft Waitemata series rocks with sandy beaches in between. At the southern end of this area is North Head, a volcano of which the rock at intertidal level is bedded volcanic ash called "tuff". This wide variety of substrates provides a large range of habitats for plant and animal communities. The wave exposure increases from south to north in this area and this is reflected in the composition of the marine communities found along the coast. There are rich faunal assemblages in the areas of soft sediments near the low tide marks of all of these beaches, but at the sheltered Cheltenham, the principal species is the cockle, whereas at the more exposed Takapuna Beach the tuatua dominates. The flora and fauna of the hard substrata, particularly the sponges, are very rich and diverse. Fragments of pohutukawa occur on the cliffs, with a significant remnant of coastal forest at St Leonards Beach, and coastal pohutukawa shrubland at North Head.	SEA-M2
62	Takapuna and Thorne Bay Fossil Forests	The area supports a particularly diverse association of marine flora and fauna. Small remnant of original pohutukawa trees (Te Uru Tapu,"the sacred grove") occurs at the northern end of Takapuna beach, with scattered pohutukawa trees along the coast, and saltmeadow, saltmarsh species and mangrove	SEA-M2

		individuals in sheltered areas.	
170	Wairau Creek Estuary	Estuary at Milford with mangroves grading into saltmarsh with oioi and saltmarsh ribbonwood. Catchment is highly urbanised.	SEA-M2
64	Long Bay and Okura Estuary		
64a	Intertidal	Within this area are a considerable variety of intertidal substrates which together form a complex array of habitats which support a variety of animal and plant communities. The communities living on the wave-cut platforms, cliffs, and beaches at Long Bay have been studied over a long period and are in reasonably good condition. This is a known location of pingao, a threatened plant of mobile sand areas. The intertidal areas within the Okura Estuary and outside its entrance range from fine mud to sand and are used as a feeding ground by several hundred wading birds. Many of these birds roost on the sandy area at the entrance to the estuary at high tide. A variety of other coastal birds feed and roost within this area. Areas of saltmarsh and mangrove line the estuary and are used by banded rail, a threatened secretive coastal fringe bird. The adjoining terrestrial vegetation which provides shelter for the birds and offers potential nesting sites. This saline vegetation and other intertidal areas grade into coastal pohutukawa forest on sheltered cliffs, then into taraire forest on coastal hill country, and finally into kanuka forest on a headland. Both of the latter are considered to be the best_examples of their types in the ecological district. At Karepiro Creek, the marine environment grades into significant coastal saltmarsh on	SEA-M1

		stabilised sand above Mean High Water Springs. Okura estuary is part of the Long Bay Okura Marine Reserve. The Okura River provides habitat for giant kokopu and long-finned eel. The Department of Conservation has selected this area as an Area of Significant Conservation Value (ASCV).	
64b		Saline vegetation and other intertidal areas grade into coastal pohutukawa forest on sheltered cliffs, then into taraire forest on coastal hill country, and finally into kanuka forest on a headland. Both of the latter are considered to be the best examples of their types in the ecological district. At Karepiro Creek, the marine environment grades into significant coastal saltmarsh on stabilised sand above Mean HighWater Springs. The Department of Conservation has selected this area as an Area of Significant Conservation Value (ASCV).	SEA-M1
64w1	Wading bird habitat	See 64a, 65a, 65b Extensive intertidal feeding habitat for waders along this coastline.	SEA-M1
65	Weiti Estuary		
65a	Intertidal	Wading birds feed in the adjacent intertidal areas to the south of the shell spits. The estuary also provides a good habitat for the coastal birds. There are also intact ecological sequences from mangroves and saline vegetation grading into coastal forest on the northern slopes of the Wade River. Here coastal broadleaved forest and shrubland forms a narrow continuous corridor from the mouth of the river to the upper reaches.	SEA-M2
65b	Shell spits	The most notable feature of this small estuary is the series of chenier-type shell spits which have formed within the estuary. These have been used to derive	SEA-M1

65c		years and are considered to be internationally significant landforms. The shellspits are a good high tide roosting site for the wading birds that feed in the adjacent intertidal areas to the south and for the coastal birds that use the estuary itself. The most seaward shellbank is particularly important as it is one of the key breeding grounds in the region for the threatened New Zealand Dotterel. Saline vegetation in the estuary grades	SEA-M1
030		into manuka- kanuka shrubland on hills, significant within the ecological district.	SEAMIT
66	Hobbs Bay intertidal area and adjacent coastal vegetation	The shore platform and the adjacent intertidal area to the west grades into notable coastal broadleaved forest and coastal manuka-kanuka shrubland on headland or peninsula.	SEA-M2
67	Whangaparaoa Peninsula, Whangaparaoa Headland cliffs and intertidal platforms	The Whangaparaoa Headland provides a valuable ecological linkage between the Auckland mainland and Tiritiri Matangi Island. Native bird species dispersing from the island include bellbirds, kaka and kakariki. The large, restored freshwater and saline wetlands within Shakespear Regional Park and bays surrounding the headland provide habitat for threatened native birds including spotless crake, fernbird, New Zealand dotterel, white-faced heron and pied stilt. The cliffs and intertidal platforms of the rocky coastline at the end of the Whangaparaoa Peninsula are made up of sedimentary Waitemata Group rocks that were deposited during the Miocene. The rocky shores and the intertidal and subtidal sediments on the southern side of the peninsula offer a complex of habitats for a variety of plant and animal communities. The rocky shores support large populations of reef-fish, kina and other invertebrates,	SEA-M1

	1		
		and a rich variety of marine algae. On one part of the shore platform the marine ecosystem grades into a significant area of natural terrestrial vegetation; a small area of complex shrubland on a headland or peninsula. The sediments of the bays on the south of the peninsula is the habitat of extensive beds of molluscs and in the north- eastern corner of Okoromai Bay grade into a saltmarsh which is a significant migration pathway for native freshwater fishes. Remnant coastal forest has been enhanced by restoration plantings within Shakespear Regional Park and large scrubland areas on the headland provide habitat for the threatened Moko and ornate skink. An Open Sanctuary has been created on the Whangaparaoa Headland with the installation of a predator proof	
		fence in 2010.	
67w1	Wading bird habitat	Extensive intertidal feeding habitat for waders along this coastline.	SEA-M1w
72	Orewa Estuary	Moderate to small sized estuary with a variety of habitats for plant and animal communities in the marine area. The harbour contains significant areas of intertidal banks where migratory wading birds feed and use this estuary as a stepping stone in their travels. A range of coastal birds, particularly shags, also feed within the estuary as do a number of species of waterfowl that utilise the estuary and the adjacent oxidation ponds on the southern margin. The mangroves and saltmarsh that occupy the remaining parts of the estuary are a habitat for banded rail particularly where adjoining terrestrial vegetation provides shelter for the birds at high tide and offers potential nesting sites. A remnant of riverine kowhai-hinau-hard beech forest occurs on the northern edge of the	SEA-M2

		Orewa River.	
72w1	Wading bird habitat	See 72 Extensive intertidal feeding habitat for waders in this estuary.	SEA-M2w
73	Waiwera Hill Ecotone	An area of foreshore and seabed that forms the marine part of an uninterrupted ecotone sequence that extends into coastal pohutukawa tree land and forest at southern end of Waiwera Hill.	SEA-M2
74	Waiwera		
74	Waiwera marine to coastal forest ecotone	The foreshore and seabed grades into significant coastal pohutukawa - puriri forest on the headland at Waiwera. This is a representative example of the original forest type which would have covered significant areas of the east coast of Rodney Ecological District and of the region.	SEA-M1
75	Waiwera, Wenderholm, and Puhoi		
75a, c		Within the Wenderholm, Puhoi and Waiwera area are a considerable variety of intertidal substrates which together form a complex array of mangrove and estuarine habitats which support a variety of animal and plant communities. The intertidal flats within the Waiwera and Puhoi Estuaries (75a, 75c) are used as a feeding ground by a variety of wading birds, many of which use these estuaries as a stepping stone in their travels. Many of these birds roost on the sandy area at the entrance to the Waiwera Estuary (75a) at high tide. A variety of other coastal birds feed and roost within this area. The coastal area provides habitat for species such as the New Zealand dotterel ('nationally vulnerable'), variable oystercatcher ('at risk' 'recovering') and the blue reef heron ('nationally vulnerable').The Department of Conservation has selected the two estuaries as Areas of Significant	SEA-M2

		Conservation Value (ASCVs).	
75b		The communities living on the wave-cut platforms at Wenderholm have been found to be diverse and in good condition. Along the hard shoreshere, the natural marine area adjoins a significant area of coastal taraire forest on a headland, and which is one of the best examples in the Rodney Ecological District. The area provides habitat for native species including kereru, long-tailed cuckoo ('gradual decline'), bellbird and North Island robins, and occasionally kaka ('nationally endangered') and red- crowned parakeet visit.	SEA-M1
75d-h	Saline vegetation in Puhoi estuary	The saline vegetation areas in the Puhoi estuary are more substantial and are some of the best in the ecological district (75d-h). North Island fern bird ('at risk') and banded rail ('naturally uncommon') inhabit the estuary particularly where adjoining terrestrial vegetation which provides shelter for the birds and offers potential nesting sites. The upper Puhoi Estuary has a diverse range of habitats including estuary, stream and freshwater wetland. Australasian bittern ('nationally endangered') reported.	SEA-M1
75i	Open beach	The open beach at Wenderholm with mobile substrates which means that benthic organisms tend to be confined to subtidal areas.	SEA-M2
75w1	Wading bird habitat	See 75b Extensive intertidal feeding habitat for waders along this coastline.	SEA-M1w
75w2	Wading bird habitat	See 75a Extensive intertidal feeding habitat for waders along this coastline.	SEA-M2w
75w3	Wading bird habitat	See 75i, 75c Extensive intertidal feeding habitat for waders along this coastline.	SEA-M2w
76	Mahurangi Harbour		
76a	Intertidal flats	The Mahurangi Harbour is a classic example of a ria or drowned coastline. Within the harbour there are large areas	SEA-M2

		of intertidal mud and sand. Outside the mouth of the harbour there are a variety of more exposed shores ranging from broad rock platforms to small sandy beaches. This physical variety provides a similarly varied range of habitats for an assortment of animal and plant communities. The large sheltered harbour is one of the best wading bird habitats in the Rodney ecological district, with banded rail and godwit recorded. The northern and upper reaches of the harbour contain intact sequences from mangroves to terrestrial forest. There are also significant areas of fringing pohutukawa forest on Mahurangi East peninsula and Mahurangi Regional Park. The Department of Conservation has selected the inner harbour area as an Area of Significant Conservation Value (ASCV). The former Auckland Regional Council (now Auckland Council) has undertaken a long-term environmental and water quality monitoring of the harbours intertidal and subtidal benthic communities since 1984. The Mahurangi Action Plan was pat up in 2004 in recongence indipations.	
		1984. The Mahurangi Action Plan was set up in 2004 in response indications that the water quality of the harbour was in decline, due to increased	
76b-j, p	Mangroves	sedimentation. In the shelter of the harbour grow extensive areas of mangroves. Some of these areas are judged to be amongst the best in the ecological district (76b - j, 76p). The saline vegetation provides high quality habitat for threatened secretive coastal fringe birds particularly where it abuts terrestrial vegetation which provides roosts for the birds and potential nesting sites. There are significant ecological sequences from mangroves into terrestrial forest in the upper Mahurangi River areas.	SEA-M1

	r		
		Mangroves at the river margin grade	
		through puriri, kowhai and taraire forest	
		to stands of young kauri and totara.	
76f	Dyers Creek	At Dyers Creek, a large expanse of	SEA-M1
		mangroves adjoins a highly diverse and	
		large area of regenerating coastal kauri	
		- tanekaha forest on lowland hills.	
76k	Cudlip Point	At Cudlip Point, the moderately	SEA-M1
		exposed rock platforms grade into an	
		important area of regenerating totara	
		forest on a headland or peninsula.	
76l	Big Bay	At Big Bay, the representative open	SEA-M1
		rocky Hormosira flats, boulders, and	
		rock pools and the open fine sandy	
		shores grade into a coastal complex	
		forest of pohutukawa, taraire,	
		kohekohe, mahoe, puriri and kowhai on	
		cliffs and hillslopes. This type of forest	
		is now relatively uncommon on the	
		mainland.	
76m,n	Saddle Island	The marine area around Te Haupa (or	SEA-M1
		Saddle) Island (76m, n) supports a	
		particularly rich and diverse biota. Here	
		too there are gradations between the marine and terrestrial ecosystems.	
76w1, 3	Wading bird	See 76a Extensive intertidal feeding	SEA-M2w

81	Motutara Point	At Motutara Point an area of foreshore	SEA-M1
		and seabed that is part of an	
		uninterrupted ecotone sequence	
		extends into one of the best areas	
		ofcoastal pohutukawa forest in the	
		ecological district.	
82	Tawharanui Peninsula		
82a		The Tawharanui peninsula contains the	SEA-M1
		best examples of open rocky intertidal	
		and subtidal marine habitats on the	
		coast of the Outer Hauraki Gulf. The	
		southern side of the peninsula (82a) is	
		representative of more sheltered rocky	
		shores and stony beaches. In contrast	
		to the Whangaparaoa Peninsula to the	
		south, the Tawharanui Peninsula still	
		has some extensive areas of natural	
		terrestrial vegetation. The adjacent	
		Tawharanui Open Sanctuary is subject	
		to an extensive restoration programme	
		including pest control and	
		re-introduction of threatened species	
		including pateke (brown teal) and NI	
		brown kiwi. It contains the best	
		examples in the Rodney Ecological	
		District of manuka, taraire, kauri and	
		pohutukawa forests on a peninsula	
		landform and also contains freshwater	
		wetlands. The marine ecosystem on the	
		south of the peninsula in particular,	
		grades into manuka forest and one of	
		two areas of notable pohutukawa forest	
		on coastal cliffs.	
82 b		The Tawharanui peninsula contains the	SEA-M1

r	1		·
		best examples of open rocky intertidal	
		and subtidal marine habitats on the	
		coast of the Outer Hauraki Gulf. The	
		adjacent Tawharanui Open Sanctuary	
		is subject to an extensive restoration	
		programme including pest control and	
		re-introduction of threatened species	
		including pateke (brown teal) and NI	
		brown kiwi. It contains the best	
		examples in the Rodney Ecological	
		District of manuka, taraire, kauri and	
		pohutukawa forests on a peninsula	
		landform and also contains freshwater	
		wetlands. The open sandy beaches	
		and mobile sands are an important	
		New Zealand dotterel breeding area as	
		well as being a threatened plant	
		habitat.	
		The majority of this area is included	
		within the marine reserve associated	
		with the Tawharanui Regional Park. The	
		Marine Reserve was gazetted in 2011	
		and includes a diverse coastline with a	
		range of subtidal habitats, such as reefs	
		with overhangs, tunnels and caves.	
		Schools of red moki, blue maomao,	
		spotty, red mullet and koheru are	
		common in the marine reserve. In the	
		Jones Bay swamp, long finned eel and	
		giant kokopu (NIWA fish database) are	
		present. The stream that runs into	
		Anchor Bay on the north is a high	
		quality freshwater fish habitat and the	
		mouth of this stream needs to be	
		considered as a migration pathway.	
83	Whangateau		
	Harbour		
83a		An important east coast harbour	SEA-M2
		characterised by a sequence of	
		depositional sands including a large	
		unconsolidated Holocene barrier sand	
		spit which provide a number of different	
		spit which provide a number of different habitats for a variety of animal and plant	

83b	and intertidal flats are of moderate-high wildlife value The intertidal sand banks are a rich feeding ground for many international migratory and New Zealand endemic wading birds including Caspian tern ('nationally vulnerable'), white-faced heron, bar-tailed godwit, New Zealand dotterel ('nationally vulnerable'), South Island pied oystercatcher ('at risk declining'), variable oystercatcher ('at risk recovering'),little egret, reef heron ('nationally vulnerable'), pied stilt ('at risk declining'), banded dotterel ('nationally vulnerable') and vagrant international migrants. The harbour is an important stepping stone in migratory species journeys. The waters of the harbour are a feeding ground for a variety of coastal birds. The Department of Conservation has selected this area as an Area of Significant Conservation Value(ASCV). The tip of the large barrier sand spit is a high tide roost for the wading and coastal birds, a key breeding ground for	SEA-M1
	the threatened New Zealand Dotterel, and a threatened plant habitat. In the lee of the sand spit grow areas of saline vegetation including eelgrass, which appears to be spreading. The tip of the large barrier sand spit has a number of important natural values. It is a high tide roost for the wading and coastal birds, a key breeding ground for the threatened New Zealand Dotterel ('nationally vulnerable'), and a threatened plant	
83c	 habitat. In the lee of the sand spit grow areas of saline vegetation including eelgrass, which appears to be spreading. South of the causeway there are important areas of mangroves and saltmarsh much of it judged to be 	SEA-M1

	Γ		
		amongst the best in the ecological district. There is an important gradation from this significant saline vegetation into a large and rare area of coastal kahikatea swamp forest beyond the coastal marine area. The saline vegetation both here and in other parts of the harbour provides high quality habitat for threatened secretive coastal fringe birds, such as banded rail ('naturally uncommon") and fern bird ('at risk declining'), particularly in saltmarshes where there is terrestrial vegetation which provides roosts for the birds and potential nesting sites.	
83d	Ti Point	Ti Point includes scattered pohutukawa forests around the cliffs. Broadleaved taraire forests are present on the headland area. Threatened species present include the regionally rare <i>Ranunculus urvilleanus</i> ('serious decline'), the nationally threatened Calystegia marginata ('declining'). Ti Point is a buffer to Whangateau Harbour. The reefs offer habitat for the threatened reef heron ('nationally vulnerable'). The rocky coastline from Ti Point north to Mathesons Bay includes breeding habitat for little blue penguin ('declining').	SEA-M1
83e	Horseshoe Island and pied shag colony	Horseshoe Island, and the sand flats and shell banks to the northeast and southeast provide a breeding site for a colony of Caspian tern ('nationally vulnerable'). A pied shag ('nationally vulnerable') colony is present on the coast north of Ti Point.	SEA-M1
83f	Omaha River and northern stream estuaries	The Omaha River and northern stream estuaries contain older stands of mangroves and saltmarsh which will provide habitat for banded rail. This estuarine vegetation is contiguous with coastal forest in a number of places.	SEA-M1
83w1	Wading bird habitat	See 83c Extensive intertidal feeding habitat for waders in harbour to south of	SEA-M1w

		causeway	
83w2	Wading bird habitat	See 83a Extensive intertidal feeding habitat for waders in harbour.	SEA-M2w
85	Leigh Reef and	Leigh Reef and Panetiki Island are	SEA-M1
	Panetiki Island	important for their representation of the	
		rocky shores and reefs of the region.	
		Leigh Reef is the only large subtidal reef	
		in the region and, due to the strong	
		movements of water across it, contains	
		a unique assemblage of encrusting	
		organisms. It also occasionally contains	
		subtropical species of fish. Panetiki	
		Island is significant for the rich fauna and	
		flora of its reef slope.	
85b	Leigh Reef to	The rocky coastline from Okakari Point	SEA-M1
	Cape Rodney	(Goat Island) marine reserve south to	85b
		Leigh Reef includes breeding habitat for	
86	Cape Rodney to	little blue penguin ('declining').	
00	Okakari Point		
	Marine Reserve		
86a		The Goat Island Marine Reserve was	SEA-M1
00a		gazetted in 1975 as New Zealand's first	
		marine reserve. The reserve and the	
		wider area is a complex of soft shore	
		and hard shore habitats with a variety of	
		exposure ratings. It provides habitat for	
		great diversity of species. The area	
		contains sequences from marine	
		habitats to coastal pohutukawa	
		broadleaved -podocarp forest. The area	
		is the location of the University of	
		Auckland's marine laboratory.	
och			
86b		Around Goat Island, a significant	SEA-M1
		ecotone grades from marine algae to terrestrial coastal forest. This marine	
		reserve is considered to be of national	
		importance. Goat Island itself is a	
		Scientific Reserve that has no animal	
		pests (other than Argentine ant) and	
		supports coastal shrubland with flax,	
		karo, mapou, kanuka and a	
		pohutukawa fringe - an association	
		considered rare in the Rodney	
		Ecological District. It is a nesting site	

		for black- backed and red-billed gulls	[]
		('nationally vulnerable'), white- fronted	
		terns ('nationally vulnerable'), while incrited	
		and shearwaters.	
87	Pakiri Beach	and Shear Walers.	
87a	Pakiri Beach	Pakiri Beach is the only exposed	SEA-M2
		mainland east coast surf beach free of	
		housing and backed by extensive sand	
		dunes and dune lakes, and is of regional	
		significance. The endemic threatened	
		sedge, pingao (<i>Ficinia spiralis</i>) ('relict'),	
		is found on the dunes along the Pakiri	
		coast. Regionally significant populations	
		of the threatened sand copromsa	
		(<i>Coprosma acerosa</i>) ('Declining') are	
		also presenton the backdunes.	
		Mangawhai is a breeding area for the	
		largest flock of New Zealand dotterels	
		('nationally vulnerable') in the Auckland	
		Region and is one of only three nesting	
		sites in the country for the 'nationally	
		critical' New Zealand fairy tern. Other	
		birds in the Pakiri area include	
		white-faced heron, blue reef heron	
		('nationally vulnerable'), banded rail	
		('naturally uncommon'), pied	
		stilt('declining') and variable	
		oystercatcher ('declining'). The beach	
		exhibits a gradation in the type of	
		sediment and associated fauna from the	
		shore out to the edge of the off-shore	
		sand-body. The fauna diversity	
		decreases getting closer to the shore	
		because of the decreasing stability of	
		the substrate, but the population	
		densities increase. The sands of the	
		beach are an important habitat for a	
		variety of plants and animals. The areas	
		of natural vegetation include important	
		areas of pingao/spinifex, Muehlenbeckia	
		shrubland, manuka scrub, and	
		pohutukawa forest. The Department of	
		Conservation has selected this area as	
		an Area of Significant Conservation	

		Value (ASCV). Pakiri Beach and River has been identified as an Important Bird Area for	
		NZ fairy tern and NZ dotterel. The NZ	
		fairy tern forage both within the Pakiri River and up to 2km out to sea.	
87b		River and up to 2km out to sea. The mouth of the Pakiri River is a particularly important part of this habitat. The Pakiri River is a tidal stream with a small estuary and bordering saltmarsh that grades into the adjacent natural sand dune plant community. The Pakiri River supports a range of wading, coastal, and secretive threatened coastal fringe birds. Many of the waders and coastal birds roost on the mobile sands at the river mouth, and some, including a range of threatened species nest there. The secretive coastal fringe birds use the saline vegetation and their habitat is enhanced by the presence of adjacent terrestrial vegetation which provides roosts for the birds and potential nesting sites. The Department of Conservation has selected this area as an Area of Significant Conservation Value (ASCV). Te Arai Stream is nationally important for NZ dotterel ('nationally vulnerable') and Poutawa Stream is a breeding site for NZ dotterel and variable oystercatchers ('at risk – recovering'). Te Arai Stream is also a post breeding flock site for NZ	SEA-M1
		fairy tern ('nationally critical') and a	
87c	Poutawa stream mouth	future nesting site for the species. Poutawa Stream is a breeding site for NZ dotterel ('nationally vulnerable') and variable oystercatchers ('at risk – recovering').	SEA-M1 87d
87d	Te Arai stream mouth	Te Arai Stream is nationally important for NZ dotterel ('nationally vulnerable'). Te Arai Stream is also a post breeding flock site and foraging site for NZ fairy tern ('nationally critical'), and a future nesting	SEA-M1 87d

		site for the species.	
161, 162, 163, 164, 165	Kawau Island	The upper reaches of North Cove and Bon Accord Harbour contain estuarine habitats with saltmarsh and mangroves grading into freshwater_habitat and into secondary kanuka forest. These area provide habitat for banded rail.	SEA-M2
91	Beehive Island, Kawau	Small 'old hat' island surrounded by large intertidal platform with contrasting white shell sand high tide beach. The term 'old hat' is used because the broad intertidal rock platforms that surround the island look like the brim of a hat and the island itself resembles the hat crown. This island is considered to be a landform of regional geological importance. The shell sand beach is a breeding and roosting area for threatened coastal birds.	SEA-M1
95	Rangitoto and Motutapu	Rangitoto Island is of international significance as a volcanic landform because each stage, from the initial colonisation of raw basalt and scoria to the formation of scrub to immature forest, can be seen. It is the youngest and largest of the Auckland volcanoes having be enactive at least within the last 400 years. More than 200 species of native ferns and flowering plants grow on the island. Dominant among the trees is pohutukawa. Kohekohe, mangeao, puriri, rewarewa, rata, puka, five-finger and manuka are also found. The island supports the largest stand of pohutukawa forest in New Zealand. The regionally uncommon ferns Pellaea calidirupium ('range restricted') and Psilotumnudum ('sparse') are present on Rangitoto. A wide range of species more commonly found as epiphytes on the mainland are found growing on the ground at Rangitoto, e.g. Griselinia lucida and Kirk's daisy. The rare Cook's	SEA-M1

		scurvy grass Lepidium flexicaule was re-introduced to the island in 2000. Birds found on the island include fantail, hawk, silvereye, grey warbler, blue reef heron, Caspian tern, kingfisher, pipit, white-faced heron, New Zealand dotterel, white-fronted tern and nests of the little blue penguin. North Island tomtits were spotted on the island in 1999. There are a number of breeding	
		colonies of black-backed gull scattered in the bare lava. It is also habitat for shore skink. Motutapu Island is predominantly pasture fringed with	
		coastal forest around the margin. Motutapu Restoration Society is leading an extensive ecological restoration project to re-establish coastal forest in	
		areas previously cleared for farming and to enhance existing coastal forest remnants that are degraded by weed infestations. Threatened coastal bird	
		species including white-fronted terns, red-billedgulls, reef herons and New Zealand dotterels breed along coastal	
		areas, particularly on the western side of the island adjoining Rangitoto Island. In 2009 Department of Conservation undertook a pest eradication programme	
		to remove remaining pests from Rangitoto and Motutapu Islands. These islands are part of the Hauraki Gulf Marine Park and are close to the mainland.	
96	Motukorea (Brown's Island)	Motukorea is free of animal pests and home to the threatened plant, sand spurge (<i>Euphorbia glauca</i>) ('declining'). The regionally threatened herb <i>Geranium solanderi</i> (Gradual Decline) is also present on the island. Pohutukawa forest is scattered along the volcanic	SEA-M2
		tuff cliffs and headlands. There is also a small dune area with range of species growing on it including spinifex, wiwi,	

		ngaio and pohuehue. The New Zealand dotterel ('nationally vulnerable'), variable oystercatcher ('recovering') and black- backed gulls breed on the island. Caspian tern and reef heron (both 'nationally vulnerable') also use the island. The island is administered by the Department of Conservation and has been selected by the Department of Conservation as an Area of Significant Conservation Value (ASCV).	
97	Motuihe Island	This island is under restoration by the Motuihe Island Trust in partnership with the Department of Conservation. Remnant vegetation covers gully and steep coastal faces and includes pohutukawa around the coastal fringe. A relatively large area of remnant coastal forest remains on the island. The island is an important breeding site for a variety of sea and shore birds and provides habitat for threatened plant species. Ohinerau Bay is an important flock and breeding site for northern New Zealand dotterels ('nationally vulnerable'). Reef heron('nationally vulnerable') and variable oystercatcher ('recovering') also frequent the bay.	SEA-M1
98	Crusoe Island (Papakohatu Island)	Papakohatu (Crusoe) Island is one of a number of small offshore islands from Waiheke used as breeding sites for coastal birds. It is an important breeding site for white- fronted tern, reef heron ('nationally vulnerable'), blue penguins ('gradual decline'), endemic variable oystercatchers, and pied and little shags.	SEA-M1
99	Motukaha Island and Fossil Bay	Motukaha Island is one of a number of small offshore islands from Waiheke used as breeding sites for coastal birds. It is an important seabird breeding site for reef herons ('nationally vulnerable'), variable oystercatchers (endemic) and	SEA-M1

		pied shags.	
101	Okahuiti Bay	A sheltered inlet, while enclosed by road, this area is one of the few places	SEA-M1
		on Waiheke Island where an ecotone	
		from mangrove forest through	
		freshwater wetlands to terrestrial forest	
		exist. The coastal forest contains	
		pohutukawa, taraire, matai and kowhai.	
157	Putiki Bay	A complex of saline wetlands grading	SEA-M2
		from mangroves to saltmarsh and in	
		places into freshwater wetland. The	
		coastal edge of the estuary is fringed	
		by pohutukawa.	
		Banded rail are present in the estuary.	
102	Koi Island	Koi Island is one of a number of small	SEA-M1
		offshore islands from Waiheke used as	
		breeding sites for coastal birds. It is an	
		important sea bird breeding site for	
		Caspian terns ('nationally vulnerable'),	
		white-fronted terns, red-billed gulls,	
		black-backed gulls, pied shags, little	
		shags, reef herons ('nationally	
		vulnerable') and the endemic variable	
		oystercatchers.	
151	Te Whau Point	A wide belt of coastal pohutukawa forest, and one of the largest remaining on Waiheke Island.	SEA-M2
103	Whakanewha	The sheltered beach, shellbank, and	SEA-M1
		associated saltmarsh of Whakanewha	
		provide a variety of habitats for a range	
		of plants and animals. The sheltered	
		beach includes an extent of intertidal	
		flats that support a variety of	
		invertebrates. The shellbank areas	
		support a variety of coastal herbs and	
		shrubs. The coastal margins provide	
		habitat for New Zealand dotterel,	
		Caspian tern and reef herons (all	
		'nationally vulnerable'), the endemic	
		variable oystercatcher and other	
		shorebirds. Secretive and threatened	
		coastal fringe birds use the saltmarshes	
		and associated wetlands, particularly as	

r			
103w1	Wading bird habitat	regenerating terrestrial vegetation abuts these areas, providing roosts for the birds at high tide and potential nesting sites. The Whakanewha Stream system and catchment is almost entirely clothed in native vegetation in contrast to the other three major stream systems in this part of Waiheke Island. The forested catchment contains a complex of regenerating kanuka and tree fern scrub with mature forest remnants including taraire and tawa forest in the gullies and pohutukawa forest on the coastal slopes. Poukaraka Wetland (also known as Rocky Bay Wetland) is large, well buffered by the surrounding forest, and extends from forest valleys upstream to the coast. The main body of the wetland is dominated by raupo with freshwater club rush (Bolboschoenus fluviatilis) and a wide variety of other wetland species are present also, distributed according to hydrological and salinity tolerances. The wetland provides habitat for Australasian bittern ('nationally endangered') and the New Zealand fern bird, banded rail and spotless crake (all classified as 'sparse'). The stream is likely to be an important freshwater fish habitat and the stream mouth and saltmarsh are therefore probably significant migratory pathways and possibly breeding areas. Shellbanks form key roosting and nesting sites for shorebirds and there is extensive intertidal feeding habitat for	SEA-M1w
		waders long this coastline.	
104	Awaawaroa Bay		
104 a		Awaawaroa Bay is an estuarine area on the sheltered southern side of Waiheke. There are extensive intertidal areas (104a) which are a feeding ground for a relatively large number of a variety of wading bird species.	SEA-M2

104 b-d		The shellbanks in Awaawaroa Bay (104b-d) are roosting sites at high tide for wading birds, along with a range of coastal birds which feed in the waters of the area. The area is also an important habitat for a number of threatened coastal birds. The bay is the second most important breeding site on Waiheke Island for New Zealand dotterel ('nationally vulnerable'). Caspian tern ('nationally vulnerable'), piedshag ('nationally vulnerable') and	SEA-M1
		variable oystercatcher ('at risk	
		recovering') also breed here.	
104 e		In the shelter of the upper reaches of the Awaawaroa Bay estuary (104e) there are substantial areas of mangroves and saltmarsh. The saline vegetation grades into substantial freshwater raupo wetlands at the head of the estuary. The wetlands are habitat for North Island fern bird ('at risk declining'), banded rail ('naturally uncommon'), spotless crake ('data deficient relict') and Australasian bittern ('nationally endangered').	SEA-M1
104w1	Wading bird habitat	See 104a, b, c Shellbanks form key roosting and nesting sites for shorebirds and there is extensive intertidal feeding habitat for waders in bay.	SEA-M1/2 w
105	Te Matuku Bay		
105a, d		Te Matuku Bay (Te Matuku Marine Reserve) is an estuarine area on the sheltered southern side of Waiheke. The extensive intertidal flats, shell banks, and low-lying islands offer a variety of habitats for a range of plant and animal communities. The extensive intertidal areas are a rich feeding ground for large numbers of international migratory and New Zealand endemic wading birds, including substantial numbers of a considerable variety of threatened	SEA-M1

105b	species. Species include: New Zealand dotterel, banded dotterel, bar-tailed godwit, caspian tern, white fronted tern, reef heron, variable and South Island pied oystercatcher, sandpiper, turnstone and wrybill. The wetland and islands provide habitat for spotless crake and bittern. The Department of Conservation has selected this area as an Area of Significant Conservation Value (ASCV). Te Matuku Bay (Te Matuku Marine Reserve) is an estuarine area on the	SEA-M1
	sheltered southern side of Waiheke. The extensive intertidal flats, shell banks, and low-lying islands offer a variety of habitats for a range of plant and animal communities. Large numbers of international migratory and New Zealand endemic wading birds, including substantial numbers of a considerable variety of threatened species roost on the shell spit in the outer reaches of the bay at high tide, along with a variety of other coastal birds which feed in the waters of the bay. Species include: New Zealand dotterel, banded dotterel, bar-tailed godwit, caspian tern, white fronted tern, reef heron, variable and South Island pied_oystercatcher, sandpiper, turnstone and wrybill. New Zealand dotterel nest along the shell spit opposite the Te Matuku Scenic Reserve. The_wetland and islands provide habitat for spotless crake and bittern. The Department of Conservation has selected this area as an Area of Significant Conservation Value (ASCV).	
105c	Te Matuku Bay (Te Matuku Marine Reserve) is an estuarine area on the sheltered southern side of Waiheke. The extensive intertidal flats, shell	SEA-M1

			I
		banks, and low-lying islands offer a variety of habitats for a range of plant and animal communities. In the shelter of the upper reaches of the estuary there are extensive areas of mangroves and saltmarsh growing in association with terrestrial vegetation on the low-lying islands and in the catchment. There is a natural ecotone sequence from saline vegetation grading into freshwater raupo wetland and into kauri-tanekaha forest with hard beech, and taraire tawa forest in the gullies. These forest values are heightened because Waiheke Island (including this area) has never had possums. Forest areas support a good number of common forest birds. Bellbirds have been released recently in the adjacent Royal Forest and Bird Protection Society Goodwin Reserve. The saline vegetation provide high quality habitat for threatened wetland birds and secretive coastal fringe birds particularly where the wetlands abut terrestrial vegetation which_provides roosts for the birds and potential nesting sites. The wetland and islands provide habitat for spotless crake, fern bird and bittern. The Department of Conservation has selected this area as an Area of	
105w1	Wading bird habitat	Significant Conservation Value (ASCV). See 105a Shellbanks form key roosting and nesting sites for shorebirds and there is extensive intertidal feeding habitat for waders in the bay.	SEA-M1w
105w2	Wading bird habitat	See 105b Shellbanks form key roosting and nesting sites for shorebirds and there is extensive intertidal feeding habitat for waders in the bay.	SEA-M1w
106	Motukahakaha ('Unnamed Islet')	Motukahakaha Island is located north of Ponui Island and is one of a number of small offshore islands used as	SEA-M1

		1	1
		breeding sites for coastal birds. It is an important seabird breeding site for reef herons ('nationally vulnerable'), variable oystercatchers (endemic) and pied shags.	
107	Frenchmans Cap	Kahakaha Island (Frenchmans Cap) is one of a number of small offshore islands around Waiheke used as breeding sites for coastal birds. It is a nesting site of the blue reef heron ('nationally vulnerable'). Black-backed gulls, white- fronted terns, Caspian terns, New Zealand dotterel and variable oystercatcher are also known to breed here.	SEA-M1
108	Tarahiki Island	Tarahiki Island is the biggest and most important breeding area in the Hauraki Gulf (and possibly the country) for the endemic spotted shag. Other birds including blue penguin, grey-faced petrel and reef heron ('nationally vulnerable') also breed on this island. The vegetation on the island contains turepo (<i>Streblus banksii</i>) ('regionally critical') and provides habitat for Pacific gecko ('declining') and common gecko. This island is part of a nationally important wildlife habitat selected by DOC as an Area of Significant Conservation Value (ASCV).	SEA-M1
109	Horuhoru Island	Horuhoru Island (Gannet Rock) is one of New Zealand's key seabird breeding sites and a nationally important site for Australasian gannets. Spotted shag ('naturally uncommon') and white-fronted terns ('declining') also breed on Horuhoru Island. Other threatened fauna recorded from the island include red-billed gull ('nationally vulnerable'), pied shag ('nationally vulnerable') and variable oystercatcher ('recovering'). The island has been selected by DOC as an Area of Significant Conservation Value (ASCV).	SEA-M1

110	Onetangi to Hooks Bay	This area is one of the best examples of exposed rocky reef habitat in the Inner Hauraki Gulf. There are significant remnants of coastal forest along the coastline dominated by pohutukawa with titoki, turepo (<i>Strebilus banksii</i>) ('regionally threatened'), whau, tawapou. Owhiti Bay contains significant ecological sequences from sand dunes with pingao, to brackish and freshwater wetlands. It is an important breeding site for New Zealand dotterel. New Zealand pipit and variable oystercatcher also breed around the Bay. Between Anita Bay and Hooks Bay are two breeding	SEA-M2
		colonies for spotted shag. Reef herons are also present on the rocky coast.	
111a, b	Woodlands Bay	The natural marine ecosystem just to the west of the Onetangi to Hooks Bay area here grades into diverse areas of coastal forest on Waiheke Island. This forest comprises coastal pohutukawa forest grading into taraire-puriri forest, with tawapou.	SEA-M1
112	Onetangi Beach	This small section of Onetangi Beach is the habitat of pingao, a threatened plant of mobile sand.	
172	Nani Island	A small offshore island to east of Palm Beach, Waiheke Island. An important breeding site for white fronted tern. Variable oystercatcher and red billed gull also breed here.	SEA-M1
159	Takapu Island (Passage Rock)	Between Ponui and Waiheke Islands. Reef herons, and pied and little shags breed here.	SEA-M1
156	Man O War Bay	An area of estuarine saltmarsh grades into freshwater wetland, swamp forest and the largest area of mature indigenous forest on Waiheke island. The wetlands and saltmarsh provide habitat for banded rail and spotless crake.	SEA-M2
153	Waikopoua Bay and Awakiripapa	Remnant coastal broadleaved forest with taraire, kohekohe, tawa and pohutukawa grading into kauri- tanekaha- hard beech	SEA-M2

	· _		1
	Вау	on ridges at Waikopoua Bay. Extensive area of coastal kanuka and manuka regenerating forests and shrublands, with broadleaved forest in gullies, with sequences from the coast inland at Awakiripapa Bay.	
154	Rangitawhiri Point	Prominent coastal forest remnant with pohutukawa, tanekaha, mangeao and kowhai.	SEA-M2
152	Opopo Bay-House Bay	Very extensive area of coastal regenerating forest grading from the coast inland. The forest contains kanuka, manuka, kauri, taraire, puriri and mangaeao. Pohutukawa grow on the coast. Reef herons are present and variable oystercatchers breed along the coast.	SEA-M2
166	Pakatoa Island	The island contains a diversity of coastal forest and shrublands. Tall pohutukawa forest grows on the southern cliffs, with karo, houpara, coastal astelia, rengarenga lily.	SEA-M2
158	Te Kawau Bay Islet	Small islet to north of Ponui Island. White fronted tern and red billed gull breed here.	SEA-M1
150a, b	Rotoroa Island	Fragments of coastal forest and shrubland with pohutukawa fringe the island. Variable oystercatcher and reef heron are present. The Rotoroa Island Trust is restoring and replanting the island.	SEA-M2
160	Scully Reef	White fronted tern, variable oystercatcher and New Zealand dotterel nest here. Hundreds of spotted shags roost here and reef heron are also present.	SEA-M1
114a-c	Mokohinau Islands	This island group is a series of small rugged offshore islands of volcanic origin including a number of steep stacks. They contain a large diversity of marine habitats including broken rock, boulder beaches, sandy bottoms, drop-offs and kelp forests. These contain a large diversity of marine	SEA-M1

		species, particularly of encrusting invertebrates and fish. This group is the closest to Auckland to contain a subtropical element in the marine biota. A number of species of coastal birds, and sea birds breed on most of the islands and stacks in the group. The cliff vegetation within the coastal environment is the habitat of several threatened plant species. This island group has been selected by the Department of Conservation as an	
		Area of Significant Conservation Value	
115	Simpson Rock	(ASCV). Simpson Rock is an isolated outcrop surrounded by deep water. Although closer to the Mokohinau Islands, the rich encrusting fauna present is more similar to that of the northern tip of Great Barrier Island. A number of new species of sponges and other encrusting taxa have been recorded	SEA-M1
110		here.	050.04
116	Little Barrier Island	The coast of this steep, rugged island of volcanic origin, contains a variety of marine habitats. These include a series of unique boulder beaches on the southern side of the island which stretch from hundreds of metres above Mean High Water Springs into the subtidal area. The boulder area supports a rich subtidal algal flora and in one place is considered to be a site of geological importance. This is the regionally significant Te Titoki Point Cuspate Foreland where two boulder barriers have connected to form a triangular shaped 25 hectare in filled flat. There are two other regionally important geological sites; the large rock fall at Pohutukawa Flat (Hingaia) and the Queens flow banded dacite; both of which are below Mean High Water Springs and in the shore above.	SEA-M1

]
117		The natural marine ecosystem grades into a highly natural terrestrial ecosystem. Some of the best forests in the Region grow here, free from the ravages of possums and the cliffs and stony beaches offer a variety of habitat for a considerable number of threatened plant species. Little Barrier Island is also a nature reserve of international significance, being the habitat of several endemic endangered bird species which breed and nest there, the most notable being the Kakapo. The island has been selected by the Department of Conservation as an Area of Significant Conservation Value (ASCV).	4476
117 а-е	Northern Great Barrier Island	The northern part of Great Barrier Island is one of the important wilderness areas in the region. Here there are long stretches of rocky shore, a number of inshore and offshore islands, and a highly natural harbour formed by a barrier sand spit. These offer a large range of habitats to a considerable variety of plant and animal communities. It is on the rocky coast that the important geological sites are to be found. Off Ora Point, Rakitu Island, in the intertidal area is a basalt flow within a rhyolitic sequence. This is the only known basalt in the Great Barrier region and as such is considered to be of regional significance. Another regionally significant geological site is the obsidian breccia on the coast of Rakitu Island (117c). This is above Mean High Water Springs, but is likely to be affected by activities within the coastal marine area. The marine biota of the rocky coast is also of high value, with diverse and dense communities of reef organisms. Components of this complex	117a = SEA-M2 117b - e = SEA-M1

ГТ		
	coast are representative of different	
	parts of the north-east coast of New	
	Zealand. Several subtropical species	
	are present, due to the occasional	
	influence of the warm East Auckland	
	current. Rangiwhakaea Bay, in	
	particular, has been found to support	
	one of the highest diversities of fish	
	species in the region, comparable to	
	that of Mokohinau Islands. An area of	
	bull kelp, a marine alga of colder	
	waters, is found at the Needles itself.	
	This is an unusual species to find in	
	this somewhat sub tropically influenced	
	marine ecosystem. The marine	
	ecosystem grades into a naturally	
	forested terrestrial system along most	
	parts of the north of this coast and	
	many parts of the coast of Rakitu Island	
	(117b). A notable area of vegetation is	
	the unmodified vegetation on Unknown	
	Island, which, because of its separation	
	from the mainland, has remained free of	
	pigs and goats. The cliffs of the coastal	
	environment of the entire area offer a	
	habitat for a variety of threatened plants,	
	as do the small areas of saline herbfield	
	in the mouths of some of the streams	
	entering Rangiwhakaea Bay (117f-i)	
	which is a stronghold for a number of	
	species of reef organisms. The	
	Whangapoua Harbour (117a, 117d) is	
	an important east coast harbour	
	-	
	characterised by a large unconsolidated	
	barrier sand spit. The varying degrees of	
	shelter offered in the harbour and along	
	the shores of the sand spit provide a	
	number of different habitats for a variety	
	of animal and plant communities. The	
	intertidal sand banks within the harbour	
	(117a) are a rich feeding ground for	
	many international migratory and New	
	Zealand endemic wading birds including	
	a number of threatened species for	

	1	I	
117w1	Wading bird	which this is a major overwintering site. The estuary (117a) and the mangrove area (117d) are an important fish breeding and juvenile fish habitat. The large barrier sand spit (117d) has a number of important natural values. It is a high tide roost for the wading birds and a key breeding ground for the threatened New Zealand Dotterel and rare Variable Oystercatcher. It is also an important area of mobile sand vegetation being, in the absence of marram, one of the few places in which the three native sand binding plants; spinifex, pingao and sand tussock, grow together. In the lee of the sand spit grow highly natural areas of mangroves and saltmarsh (117d). There is an important gradation from this significant saline vegetation (117d) into areas of freshwater wetland and native forest beyond the coastal marine area. The saline vegetation and the associated freshwater areas provide high quality habitat for a large proportion of the entire population of brown teal, an endangered waterfowl. The brown teal are particularly numerous in the upper estuary (117d), but are also found at Harataonga Stream (117e) and, in substantial numbers, at Mabey's Farm Stream (117d). The Department of Conservation has selected the area of the proposed marine reserve at Whangapoua and Rakitu Island as an Area of Significant Conservation Value (ASCV).	SEA-M2w

118	Awana Stream	This is a tidal stream which in conjunction with the freshwater areas, scrub areas, and roosting sites in the coastal environment above Mean High Water Springs, is an internationally significant habitat for brown teal, an endangered waterfowl. The stream provides the best feeding area on Great Barrier Island for the species.	SEA-M1
119 a	Kaitoke	Kaitoke Beach is an important area of mobile sand vegetation, being one of only two places in the region in which the three native sand binding plants, spinifex, pingao and the sand tussock grow together. The latter two species are considered to be threatened plants.	SEA-M2
119b,c		Kaitoke Stream (119b) is a tidal stream which, in conjunction with the associated freshwater swamp, scrub areas, and roosting sites in the coastal environment above Mean High Water Springs, is an internationally significant habitat for brown teal, an endangered waterfowl. Brown teal are also found at Kaitoke Beach South Stream (Blackwells Creek) (119c) which is considered to be in its own right, a nationally important site.	SEA-M1
120 and 121	Medlands Beach North, Great Barrier (Sugarloaf Creek)	These are tidal streams which, in conjunction with the freshwater areas, scrub areas, and roosting sites in the coastal environment above Mean High Water Springs, are internationally significant habitats for brown teal, an endangered waterfowl.	SEA-M1
	Mitchener Road Creek, Great Barrier (Saltwater Creek)	These are tidal streams which, in conjunction with the freshwater areas, scrub areas, and roosting sites in the coastal environment above Mean High Water Springs, are internationally	SEA-M1

		significant habitats for brown teal, an endangered waterfowl.	
122 a-b	Southern Great Barrier Island	The rocky marine habitats (122a) of this section of coast are less exposed than those of the northern and eastern coasts of the island. Here there are banks of boulders as well as kelp forests and rocky barrens. The fish fauna is more similar to that of the mainland coast and includes fewer subtropical species than the more exposed coasts. Near Cape Barrier (122b), the natural marine ecosystem grades into the best coastal forest on Great Barrier arranged in the most intact beach to ridge top forest sequence in the southern part of the island.	122a = SEA- M2 122b = SEA- M1
123, 124 and 125	Shoal Bay Stream	These are tidal stream mouths which, in conjunction with the freshwater areas, scrub areas, and roosting sites in the coastal environment above Mean High Water Springs, are habitats of at least regional significance for brown teal, an endangered waterfowl.	SEA-M1
	Par Beach South Stream	These are tidal stream mouths which, in conjunction with the freshwater areas, scrub areas, and roosting sites in the coastal environment above Mean High Water Springs, are habitats of at least regional significance for brown teal, an endangered waterfowl.	SEA-M1
	Par Beach North Stream	These are tidal stream mouths which, in conjunction with the freshwater areas, scrub areas, and roosting sites in the coastal environment above Mean High Water Springs, are habitats of at least regional significance for brown teal, an endangered waterfowl.	SEA-M1

This is a tidal stream mouth which, in conjunction with the freshwater area, scrub areas, and roosting sites in the coastal environment above Mean High Water Springs, is a habitat of at least regional significance for brown teal, an endangered waterfowl. The threatened coastal fringe bird the banded rail has 	SEA-M1
		coastal fringe bird, the banded rail, has also been recorded using the wetland area in the Whangaparapara Harbour.	
128	Mahuki Gannetry	The eastern tip of Mahuki Island in the Broken (Pig) Island group is the site of one of the major breeding colonies of the Australasian gannet in the region.	SEA-M1
129	Unnamed Stack, Broken (Pig) Islands	This unnamed stack in the Broken (or Pig) Island Group is the only rat-free island in the Broken Island group. Large numbers of geckoes occupy this island and diving petrels and fluttering shearwaters breed in the scrub. The marine ecosystem grades into important coastal vegetation, most of which is petrel-induced coastal scrub mainly of taupata (<i>Coprosma repens</i>).	SEA-M1
130 a	Port Fitzroy	In contrast to the barrier estuaries on the eastern side of the island, this deep estuary is formed from a drowned valley. None of the other offshore islands in the region contain estuaries. This is an important fish feeding and shellfish habitat.	SEA-M2
130b, c		Forestry HQ Bay Stream (130b) and Wairahi Stream (130c) are tidal stream mouths which, in conjunction with the freshwater areas, scrub areas, and roosting sites in the coastal environment above Mean High Water Springs, are habitats of at least regional significance for brown teal, an	SEA-M1

·			
		endangered waterfowl. This area is also a habitat for secretive coastal fringe birds such as the threatened banded rail. These two areas (130b, 130c) make up part of the area chosen by the Department of Conservation as an Area of Significant Conservation Value	
130d		(ASCV). Kiwiriki Bay is an important ecotone grading from marine vegetation through to protected terrestrial forest areas.	SEA-M1
131 and 132	Karaka Bay	These are tidal stream mouths which, in conjunction with the freshwater area, scrub areas and roosting sites in the coastal environment above Mean High Water Springs, are habitats of at least regional significance for brown teal, an endangered waterfowl.	SEA-M1
	Motairehe Bay and Swamp	These are tidal stream mouths which, in conjunction with the freshwater area, scrub areas and roosting sites in the coastal environment above Mean High Water Springs, are habitats of at least regional significance for brown teal, an endangered waterfowl.	SEA-M1
133 a - f	The Noises	Group of small rocky islands which support a diverse and abundant range of coastal and sea birds. The reef heron, a threatened endemic wading bird is also commonly seen on the islands. Maria Island (133a) is one of the few breeding sites in the region of the spotted shagand the white-faced storm petrel.	SEA-M1
134	Mawhitipana Headland and Foredune	This area of beach contains dune lands with pingao, a threatened plant ('recovering') of mobile sand, one of the few sites remaining sites for the species on Waiheke Island.	SEA-M1
